

Supplementary Material.

Figures S1 to S24, show the expected relative seasonal changes in daily absolute precipitation (mm/day) and daily mean temperature ($^{\circ}\text{C}$) throughout the XXI century per meteorological station and each of the climate change studied scenarios (RCP4.5 and RCP8.5). Results are shown as 30-years moving average against the 1971-2000 average (used as a reference). The vertical dotted line indicates the end of the historical experiment (black) and the start of the RCPs. Thick lines show the median of the values for all models; the shaded area indicates ranges from the 10th to 90th percentiles. Seasons are indicated by the initial letter of their months.
