

# Supplement of

# Root water uptake patterns are controlled by tree species interactions and soil water variability

#### Supplement

Figure S1 Histogram of the soil bulk density and volumetric water content at field capacity in the research site.

**Figure S2** Temporal stability of soil water content at top and subsoil based on the spatial deviation of the measurements recorded at all sensor locations throughout the sampling period (April-August 2019)

## Supplement

Figure S3 Temporal stability of throughfall patterns based on the spatial deviation of the paired throughfall collectors' measurements in 2019 (April-August).

### Supplement

**Figure S4** The Pearson correlation plots of the patterns: (left-above) root water uptake-throughfall, (right above) root water uptake-soil water, and (left below) soil water-throughfall patterns. The correlation coefficient is shown with 'R' together with the level of significance (p).

Fixed Factors (single)	Estimate	p- value	t-value	
Spatial average of soil water storage in	0.11	0.32	-1.032	
the monitored soil layer (S)		0.02	11002	
Spatial deviation of soil water storage from the mean ( $\delta$ S)	0.44	0.000158***	3.880	
Field capacity of the monitored soil layer (S <sub>FC</sub> )	- 0.12	0.505984	-0.675	
The median of spatial deviation of				
throughfall measured within the whole	0.25	0.072182	-1.887	
sampling period $(\delta P_{TF})$				
Inverse distanced basal area (BA)	- 0.03	0.876059	-0.158	
Number of species $(n_{sp,tree})$	0.02	0.927599	0.092	
Fixed Factors in an interaction				
$\delta S \times S_{FC}$	- 0.35	0.000916***	-3.420	
$\overline{S} \times BA$	0.15	0.004420**	2.888	
$n_{sp,tree} \times BA$	1.05	0.000444***	4.254	
Random factors				
	Variance	Std.Dev		
Soil moisture sensor location	0.54	0.73		
Dry period	0.09	0.31		
Residual	0.37	0.61		
REML criterion at convergence	415.8			
AIC	441.8043
