Received and published: 3 May 2013

Two comments have been received, and the open discussion is now closed. I would encourage the authors to post responses to the individual comments, before providing a final revised manuscript. Both reviewers asked for aspects of the assimilation methods used in the paper to be placed in a wider context of the alternatives available. Among other points, Reviewer #1 asks how the retrieval of flow with just water levels might be improved, and Reviewer #2 asks whether the calibration and validation periods overlap. Both reviewers make requests for clarification or additional information.
