The Key Words should not repeat words already included in the title. Key words are meant to assist during literature searches to narrowing down to papers dealing with specific aspects. If words in the title are used as key words, this does not assist other researchers when they do electronic searches. Why should the sand content be negatively related to the initial abstraction? In other parts of the world, the sand content increases the initial abstraction. A clear explanation is requires of the reason for the model being able to predict more accurately the runoff volume than the runoff rate. By runoff volume, you presumably mean the total volume of runoff over a given time period. This total volume is normally obtained from the runoff rate and the time period.
