Interactive comment on "Testing the realism of a topography driven model (FLEX-Topo) in the nested catchments of the Upper Heihe, China" by H. Gao et al.

H. Gao et al.

h.gao-1@tudelft.nl

Received and published: 27 January 2014

Dear Reviewer 2,

Thank you for your efforts and valuable contribution to our manuscript. We very much appreciate your comments and suggestions. We shall improve the manuscript based on your suggestions and comments.

Comment: The conclusions that FLEX-T is better transferrable than the other models is most likely correct, but is based on the results from only two sub-catchments. Some C7487

more considerations of the validity of the results would be recommended.

Answer:

In the reply to Reviewer 1, we did additional test to distinguish the effect of model complexity on model performance. It showed that landscape classification is essential to be included in model transfer. However, we will make it clearer in the revised manuscript that, at this point, the interpretation is only valid in the study catchment and that subsequent studies will to test this hypothesis further in other regions in order to evaluate the generality of the findings.

Comment: The water balance on page 83-84 should be in a table.

Answer:

Thank you for your suggestion. We already showed the water balance in figure 10. In this paragraph, we would like to illustrate and explain all the modelled fluxes. Another table would repeat the same results as shown in the figure.

Minor comments:

P64 L9 "accounts for" means "explains". Is this correct here?

Answer:

We changed into 'it takes spatial variable forcing into account'.

P64 L14 "evaluated at two nested sub-catchments" - or "evaluated for two upstream sub-catchments"

Answer:

	s the average snow amount valid for the stations or for the catchment? e is more snow higher up, this should be clarified.
Answer:	
It is for the	catchment average snow amount. We shall make this clearer.
P69 L10-1 steps, step	5 It would be good to know the typically size of terraces (width betwe size)
Answer:	
unit which groundwat It can be so dry seasor	ce is not defined exactly as in agriculture. It is rather defined as a landscal is higher above the nearest stream (and thus arguably higher above the retable) than a wetland, but, in contrast to hillslopes, exhibiting low slope een aas a landscape element that connects the wetland and the hillslope. It is free of water, but in flood periods, it may be inundated. So typically neasure the width between steps and step size.
P71 L2 l g	uess it is "cloud free" LANDSAT images
Answer:	
You are rig	ht. We shall change correspondingly.
P75 L7 ch:	ange "where" to "and"

We could not get any estimation for the prior parange. We just set a large range of parameter sets, and let the automatical algorithm find the optimal parameters. The prior parameter is a large range of parameter sets, and let the automatical parameter sets. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters. The prior parameter is a large range of parameter sets, and let the automatical parameters.

P86 L13 and 16 "reason for overestimation" is probably better

Answer:

We shall make this correction in the final version.
