Based on the two reviews and my own reading, this is a timely and interesting contribution on glacial runoff in the Canadian Rocky Mountains. The paper presents valuable field measurements and thoughtful analyses of these. While both reviewers are very positive about the paper and only ask for minor revisions, they also provide a detailed list of valuable points where the manuscript could be improved. Mainly these are requests for clarifications or suggestions to improve the presentation, which should be straight-forward to address. Some questions indicate the curiosity this manuscript has stimulated in the reviewer's mind. I am looking forward to the authors answers in the discussion and/or the the revised manuscript.
