Dear all, I would suggest to consider the following paper when discussing CMIP5 climate models ability in representing changes in the right tail of the precipitation distribution:

Scoccimarro E., S. Gualdi, A. Bellucci, M. Zampieri, A. Navarra (2013): Heavy precipitation events in a warmer climate: results from CMIP5 models. *Journal of Climate*, DOI: 10.1175/JCLI-D-12-00850.1
