The authors state in the paper that all the data used in the study have been subject to quality control before being included in the study. On this basis, the comments we made in our analysis and conclusions arising consider that there is no doubt on this point. Mr. BODIAN who used data from some stations of the study in his own work says that the series are very lacunar at the same stations, which is very common in this region.

If there is a single doubt about the quality of data used in the study, all findings are subject to questioning. The question therefore needs to be clarified by the authors.
