

Interactive comment on “Adaptation of water resource systems to an uncertain future” by C. L. Walsh et al.

H. Maier

holger.maier@adelaide.edu.au

Received and published: 6 October 2015

This paper addresses an important problem and presents a nice application of a reasonably standard approach to a case study. While the results are interesting, I believe that the value of the paper to the community working in this field could be improved considerably if this research was tied into other work in this area. This should be done both in the Introduction so that it is clear where this work fits in with other recent efforts tackling the same problem, as well as the discussion to highlight similarities and differences between the findings of this and other studies. In addition, it would be useful to discuss potential limitations of the approach used in light of recent papers that have introduced more advanced methods for tackling the problem being addressed.
