In their response, the authors explain some methodological details that could potentially be found in a non-public EDF report (Dufour and Garçon, 1997).

I would like to invite the authors to add as much information as required to the main manuscript (namely for the definition of the parameters  $a(k,d)$  and  $b(k,d)$ ) and to consider writing a short supplementary section containing all useful details. This is a good option to deal with the problem of non-publicly available sources.
