I went through the HESS Opinions and found it interesting. I just would like to suggest author to reword some terms to not confusing readers. First, since white models cannot be achieved particularly in watershed hydrology, it is always advised to either use grey box or models tends to white boxes type. Second, since conceptual modeling is supposed as the main back bone for any type of modeling, it is not advised to put it against physical concepts. The author may talk about physical models against subjective models. These type of terminologies have to be therefore addressed throughout the manuscript. With my best wishes
