

Interactive comment on “Calibration of hydrological model parameters for ungauged catchments” by A. Bárdossy

A. Bárdossy

Received and published: 24 November 2006

1. In order to make the paper more readable I added a map of the selected catchments and a table containing their properties. In order to make the paper more readable the text was slightly extended and more results are presented in the revised version of the paper. (The summary of the paper in the review demonstrates that the ideas can be presented in an even shorter form.) The reasons why and when a transfer works could not be cleared in this paper. The main message that parameters are not “individuals” but “teams” however is stated clearly in the two examples.

2. All minor comments were considered.
