Without reading the referenced literature the TETIS model can not be understood. The basic equations for the 5 different tanks should be given in the paper. Then the reader can better understand the relevance of the empirical parameters and their physical meaning. Also a table in which all empirical parameters are given and the parameters are explained would be very helpful. Unclear is the linkage between the tanks, is the exchange of water uni-directional or can it change. Especially between the groundwater tank and the channel tank interactions in both directions are possible.
