Received and published: 10 June 2009

To be considered for a review in HESS, the paper will need substantial revisions both with respect to the quality and style of presentation (incl. a proper consideration of the literature) and the depth and extent of the analysis. As suggested in their replies to the reviewers, the authors shall use (many) more Landsat and Modis images outside the experimental campaign, in order to be able to assess the robustness of their methods.
