Received and published: 24 June 2009

The comments here have been useful and instructive. We agree that the manuscript needs some overhaul in order to be more applicable to hydropedology readers. The first reviewer was correct in his assertion that the authors are not hydropedologist, but specialist in the field of hierarchy theory invited to participate in this discussion. We especially appreciate the detailed and useful feedback by the anonymous review. We plan on systematically revising the paper based on those comments and suggestions. We will be collaborating with a hydropedologist throughout this process in order to ensure the explicit application of theory to the specific problems encountered in this discipline.
