Received and published: 23 March 2010

We have received three reviews for this paper, which all provide useful comments. While all reviewers found the paper interesting, they also raise important issues which will have to be addressed before the paper might be published in HESS. The presentation needs to be improved; this includes both structure and language (please seek professional help from a native speaker) and some of the figures, but also issues like the clear definition of the term ‘extreme events’. Reviewer #3 also asks for more statistical analyses, and raises issues concerning validation and boundary conditions.

C3520

Please address all these issues, and the different minor comments, when submitting the revised version of this manuscript.
