Received and published: 4 May 2009

The research topic of this paper definitely suits the HESS journal. However, the current version needs to undergo major revisions before it can be accepted for publication. Both reviewers raise some important comments along with some minor remarks. I urge the authors to carefully address each of these comments. Especially, major attention should be given to:

- better stating the overall objective of the paper;
- discuss the representativeness of the three rain events for the local climatology,
C570

and reflect on the robustness of the obtained results;

- revise the discussion on the vertical wind shear. This may include the use of re-analysis data as suggested by Steve Guimond;
- elaborate on the dual-Doppler analysis;
- improve the quality of figures as they are often not readable;

Finally, I would suggest to the authors to let their document be proof-read by a native speaker as current version contains many grammatical errors.

Looking forward to receiving a revised manuscript,

Kind regards, Niko Verhoest
