

Interactive comment on “Why hydrological forecasts should be evaluated using information theory” by S. V. Weijs et al.

S. V. Weijs et al.

s.v.weijs@tudelft.nl

Received and published: 12 October 2010

Just after submission, I noticed two errors that cause confusion:

C2846, second paragraph, last line: Change: The latter thus contains more information for the model. into: The former thus contains more information for the model.

C2849, second paragraph: (i.e. likelihood) -> (i.e. that is not likelihood) Information is thus connected to likelihood and non-local scores are not.

I apologize for the confusion this may have caused.
