

Interactive comment on “Regional-scale identification of groundwater-surface water interaction using hydrochemistry and multivariate statistical methods, Wairarapa Valley, New Zealand” by M. R. Guggenmos et al.

Anonymous Referee #1

Received and published: 25 August 2011

In general terms, the use of English language is very correct and comprehensible and the figures are very clear as well. However, there are some suggestions about the figures and tables and little typographic corrections/suggestions about the text that I would like to remark:

In table 1, S26/0001 has no value in bold text marking which value might have led the site to be identified as outlier.

In table 3, HCO₃ is not marked in bold despite being referred in the text as one of the elements with higher weighting.

Figures 2a-2c are only readable when using zoom 300%, if it were possible to separate them, they would be easier to consult. As well, I would rather recommend color scales than grey scales for the maps.

Figure 6 should be corrected on its legend on line 2 and 3 (see attached pdf).

In Figure 9 it might be useful to put the axes crossing at (0,0) so it would be easier to distinguish when the values of each component tend to be negative or positive.

During the text, clusters are referred as “cluster” (with lower case c) at the beginning and tend to be referred as “Cluster” (with capital C) at the end. I would homogenize them.

Other typographic corrections/suggestions are found on:
