I went over the manuscript and all points raised by reviewers. I found that the paper makes a significant contribution to the issues linked to watersheds located in semiarid regions. The authors's reply to reviewers comments is satisfactory. To make more "beef" their work, I recommend that the authors, as best they can, address in the revised manuscript the questions that reviewers have raised. In particular, I think that the following points need to be better clarified: 1) the hydrological conditions wherein the analysis is carried out; 2) the low influence of ASM in the runoff production, for

C3703

the investigated watersheds; 3) the RHEM model parameterization and, finally, 4) the description of results in the Conclusion section.
