As a comment from my side, I would firstly thank the referees for their very good work in making interesting comments, but also and chiefly in raising some key points useful for a revised version of that paper. Apart from the referees' points, most of which appear to be taken in by the authors, I'd stress on the following question (already discussed a bit with the first author separately): the overall castle of setting-up this simplified method can be mined at its foundation by a not well explained and presented matter regarding the retrieving and use of the necessary soil depth information. I think that point also
