We have received three excellent reviews for this manuscript, which all provide useful comments on how to improve this manuscript. All three reviewers found this contribution interesting, but also raised important issues. Some points are related to the need for better descriptions (10-fold cross validation!) or a better structure of the text (separate methods and results). Furthermore, the terminology should be reconsidered, i.e. what is quantile mapping and what not? A general problem of any bias correction method is the question of how applicable these are for future conditions. This prob-

C2855

lem should at least be mentioned/discussed. In the revision please consider all points raised by the reviewers carefully.
