Received and published: 12 December 2012

We would like to thank Referee # 1 for providing many valid and applicable comments, that certainly would improve the work and its presentation. We only have one doubt on the interpretation of the Comments (see Comment 8) and will consider any additional suggestion that the Referee may offer in the remaining of the Discussion Phase and/or next phase. #8. Many assumptions are stated in various sections. More justifications should be provided on these assumptions. Evaluation on how they will affect the results should be made. R. I do not fully understand this suggestion. If possible, I would need a more specific point of what “assumptions”. In this manuscript, only p12005 line 26 did mention “assume”.
