Dear authors, your manuscript has received two referee comments, which are crucial, in my opinion, to improve the quality of your paper. I encourage you to submit your responses as soon as possible to enhance the discussions and allow the evaluation of the manuscript for potential revisions and eventually its final publication in HESS. More specifically, I have the following additional comments: 1) consider submitting the figures with an improved quality as supplement material together with your replies to the referee comments. This is important to allow us to correctly evaluate their value with respect to the scientific results of the paper; 2) clarify the role of the parameter w . In this regard, section 3.2 deserves to be improved with further details on the pro-

C1

cedure adopted; 3) please, also check the requirements for additional results on the studied catchments (those not shown in the current version of the paper) and other months/seasons. This could bring robustness to your conclusions. We are looking forward to your reply and contribution to the open discussion. Best regards, Maria-Helena Ramos.
