Received and published: 16 August 2017

Reviewer 1 suggested to add some data on isotopes to this paper or a figure illustrating the variation of Lake Lakasse isotopic composition. The authors respond to this saying that all the data is available in other papers of the same author group. I would like to add a comment to this: a scientific paper should be nice to read independant of other papers (as far as possibly); adding some additional information already published elsewhere can be a good choice. This in particular holds if the data has been previously published in journals that are not open access.
