

Interactive comment on “Uncertainty quantification in application of linear lumped rainfall-runoff models” by Ching-Min Chang and Hund-Der Yeh

Received and published: 3 February 2017

The paper contains virtually no hydrology but is stuffed with 'mathematicity', some of it over complicated. The 2 figures (there are only 2) display the link between theoretical parameters derived from a linear model, but there is not one figure showing rainfall and the attendant runoff. There is no mention of Dooge, Nash nor Diskin. I would NOT recommend it for HESS.
