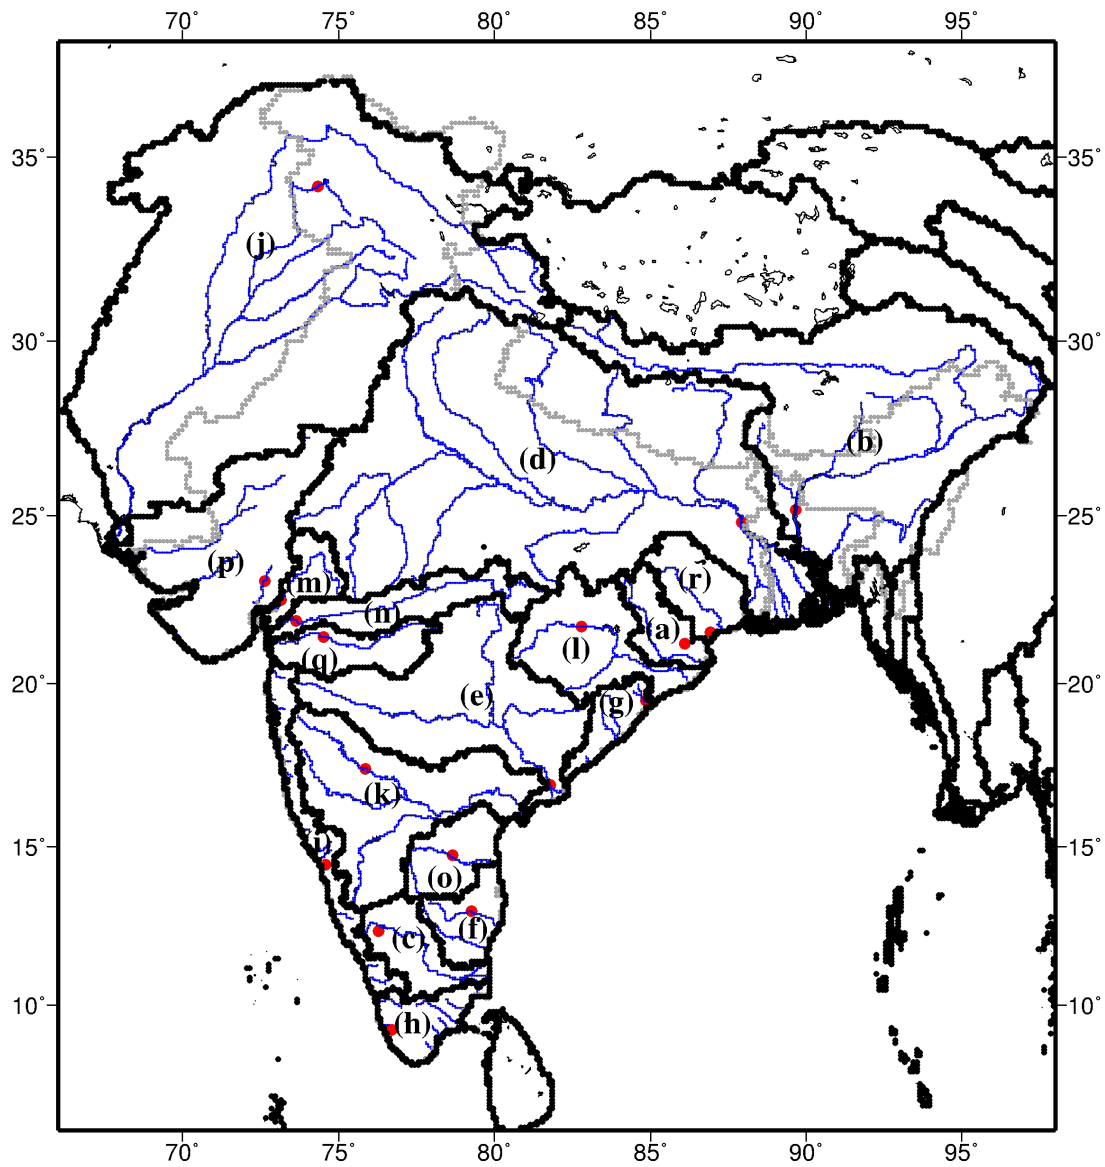

Figure S1: Map of gauge stations used for calibration and validations of models (shown with red color filled circle), river network (shown with blue color line) and basins (bordered with black color line, Refer basins name in Table 2) of India. Boundary of India is shown with grey color.

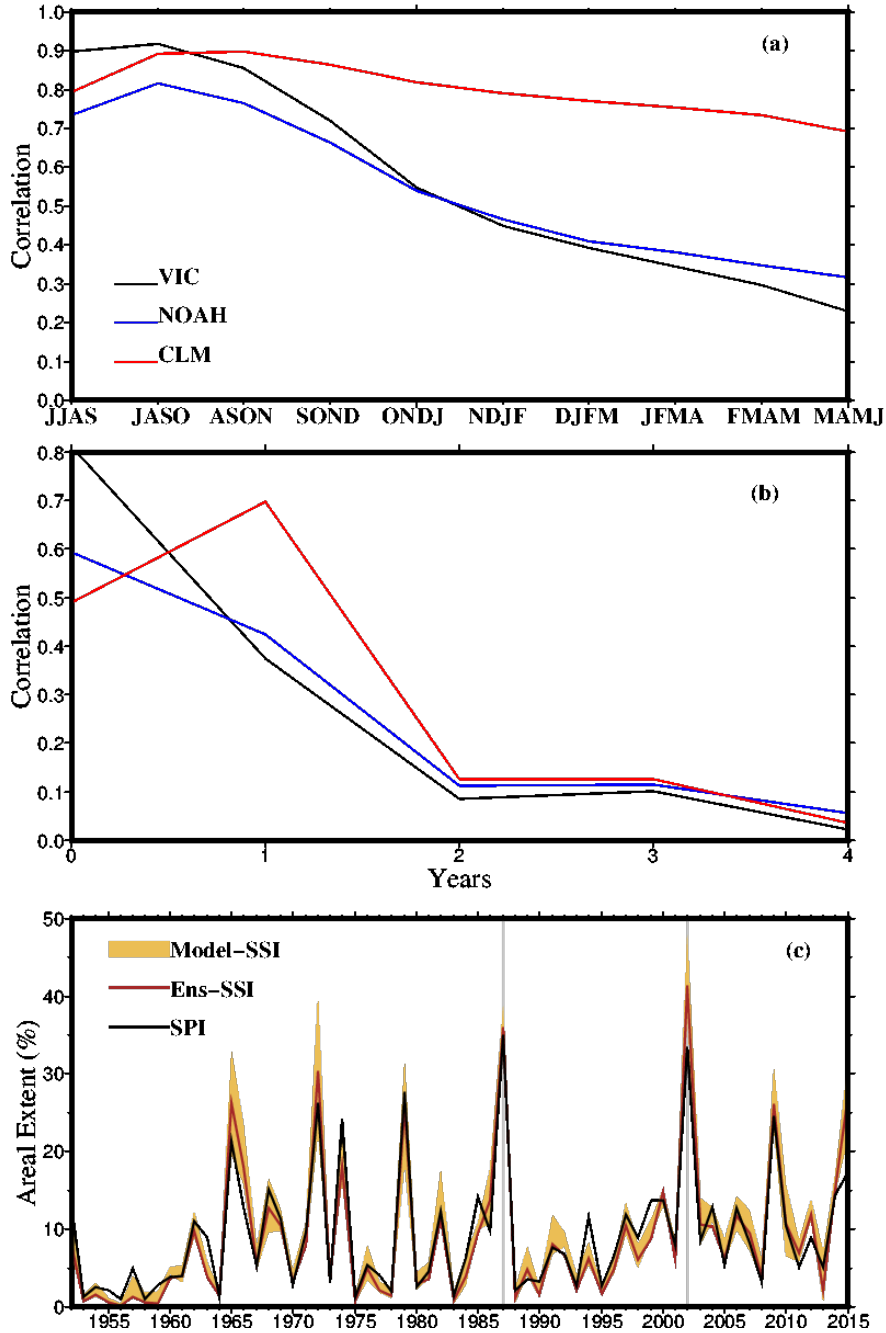

Figure S2: (a) Correlation between 4-month SPI at the end of the monsoon season (JJAS) and 4-month SSI (root-zone soil moisture) at different leads. (b) Correlation of 12-month SPI at the end of December with 12-month SSI at lead varying from 0-48 months. (c) uncertainty in areal extent of root-zone soil moisture drought based on the lead time for which 4-month SSI shows the highest correlation with the 4-month SPI at the end of the monsoon season. Black line in (c) shows 4-month SPI at the end of the monsoon season. Shaded area shows indermodel uncertainty estimated using one standard deviation. Gray lines show major drought events.

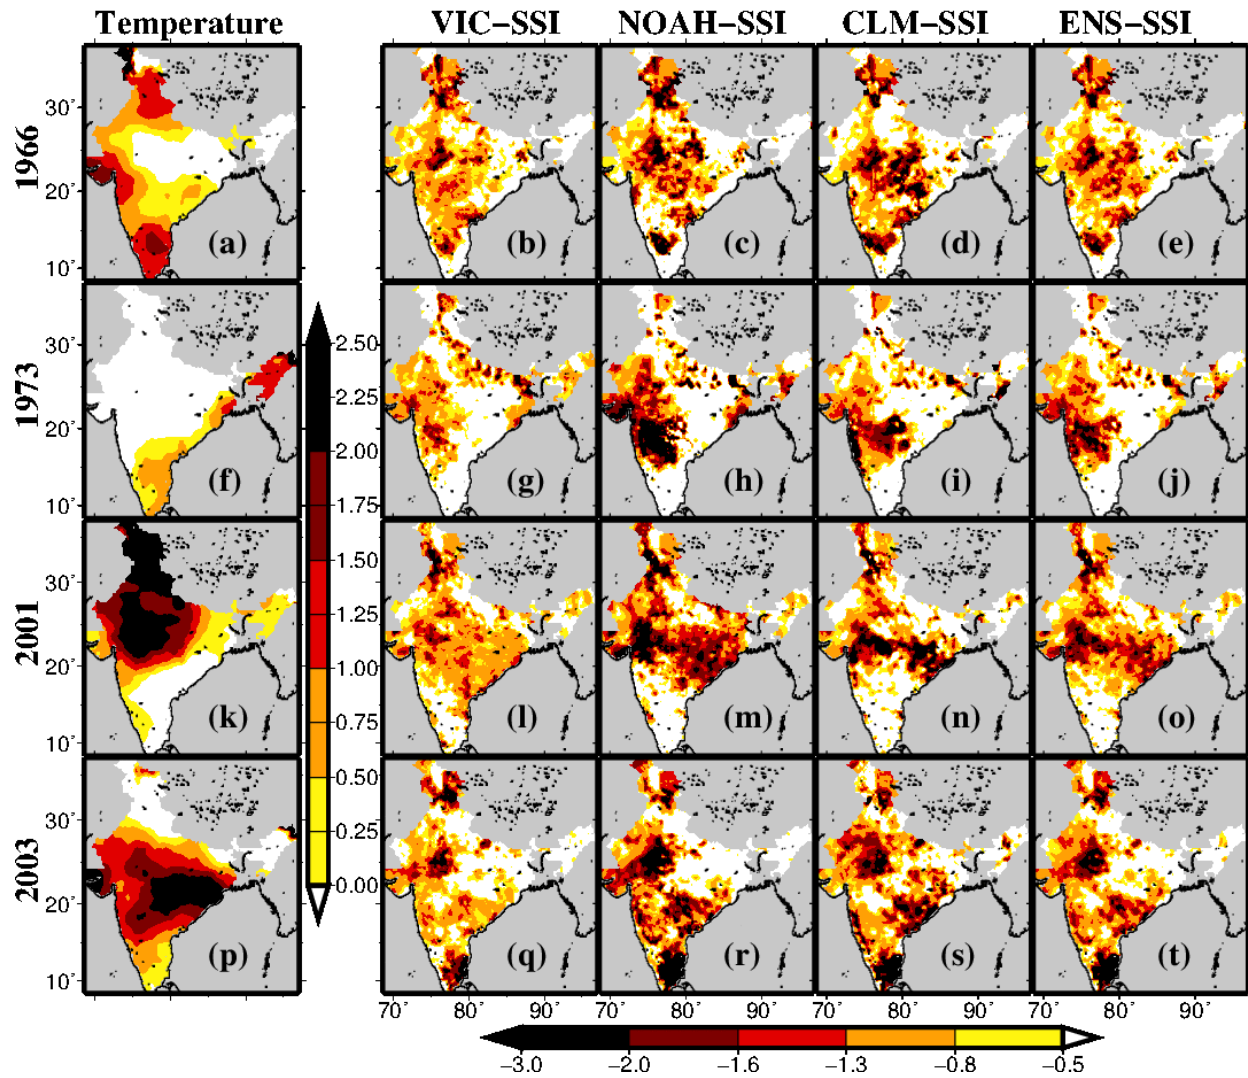

Figure S3: Reconstruction of the Rabi season (NDJF) drought events of (a-e) 1966, (f-j) 1973, (k-o) 2001, and (p-t) 2003 estimated based on (b,g,l,q) 4-month SSI at the end of February estimated using root-zone soil moisture from the VIC model, (c,h,m,r) 4-month SSI simulated using the Noah model, (d,i,n,s) 4-month SSI simulated using the CLM and (e,j,o,t) ensemble mean of 4-month SSI simulated using the VIC, Noah and CLM. (a,f,k,p) Air temperature anomaly during the Rabi season for the respective years.

Figure S4: Uncertainty in Intensity-Areal Extent [%]-Frequency [IAF] curve of drought during Rabi season (November through January) estimated using three LSMs [Dark brown color shade shows uncertainty in models without considering distribution uncertainty while light brown color with considering distribution uncertainty] for all-India with return periods (a) 10, (b) 20, (c) 50, (d) 100, (e) 200, and (f) 500 years. Black error-bars indicate uncertainty Intensity-Areal Extent [%] for 2001 Rabi season drought using three LSMs.

Figure S5: Same as Fig. 4 but for 12-month SSI at the end of December for the Indo-Gangetic Plain.

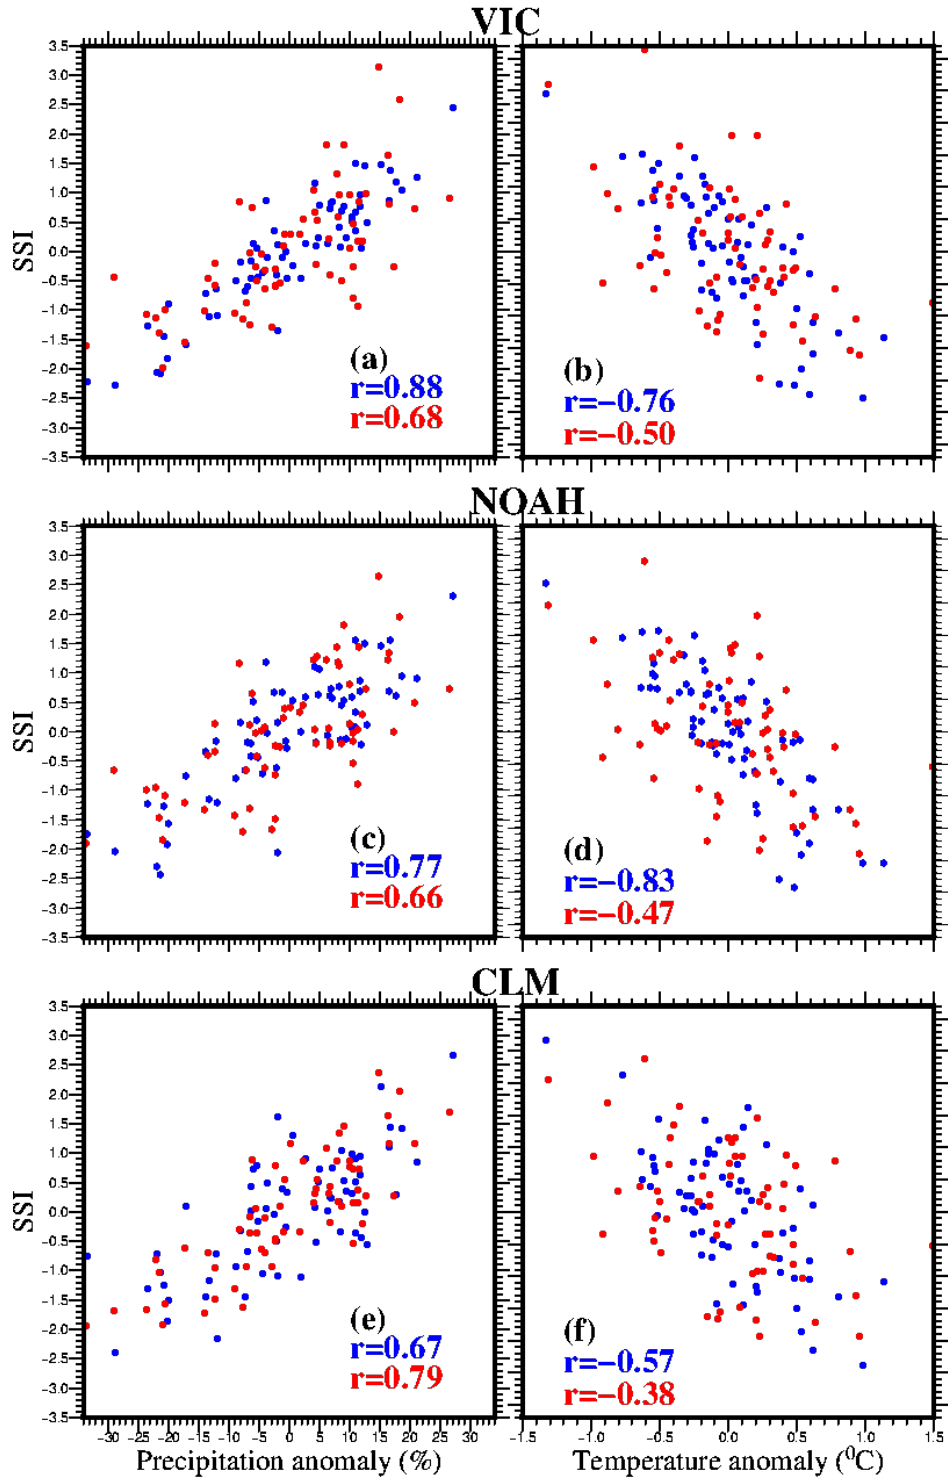

Figure S6. (a,c,e) Relationship between monsoon season precipitation anomaly (%) and 4-month SSI at the end of the Rabi season and (b,d,f) same as (a,c,e) but for the relationship between 4-month SSI and air temperature anomaly of the Rabi season. Correlation coefficients are shown for all-India SSI (blue) and 4-month SSI of the Indo-Gengatic Plain (red).

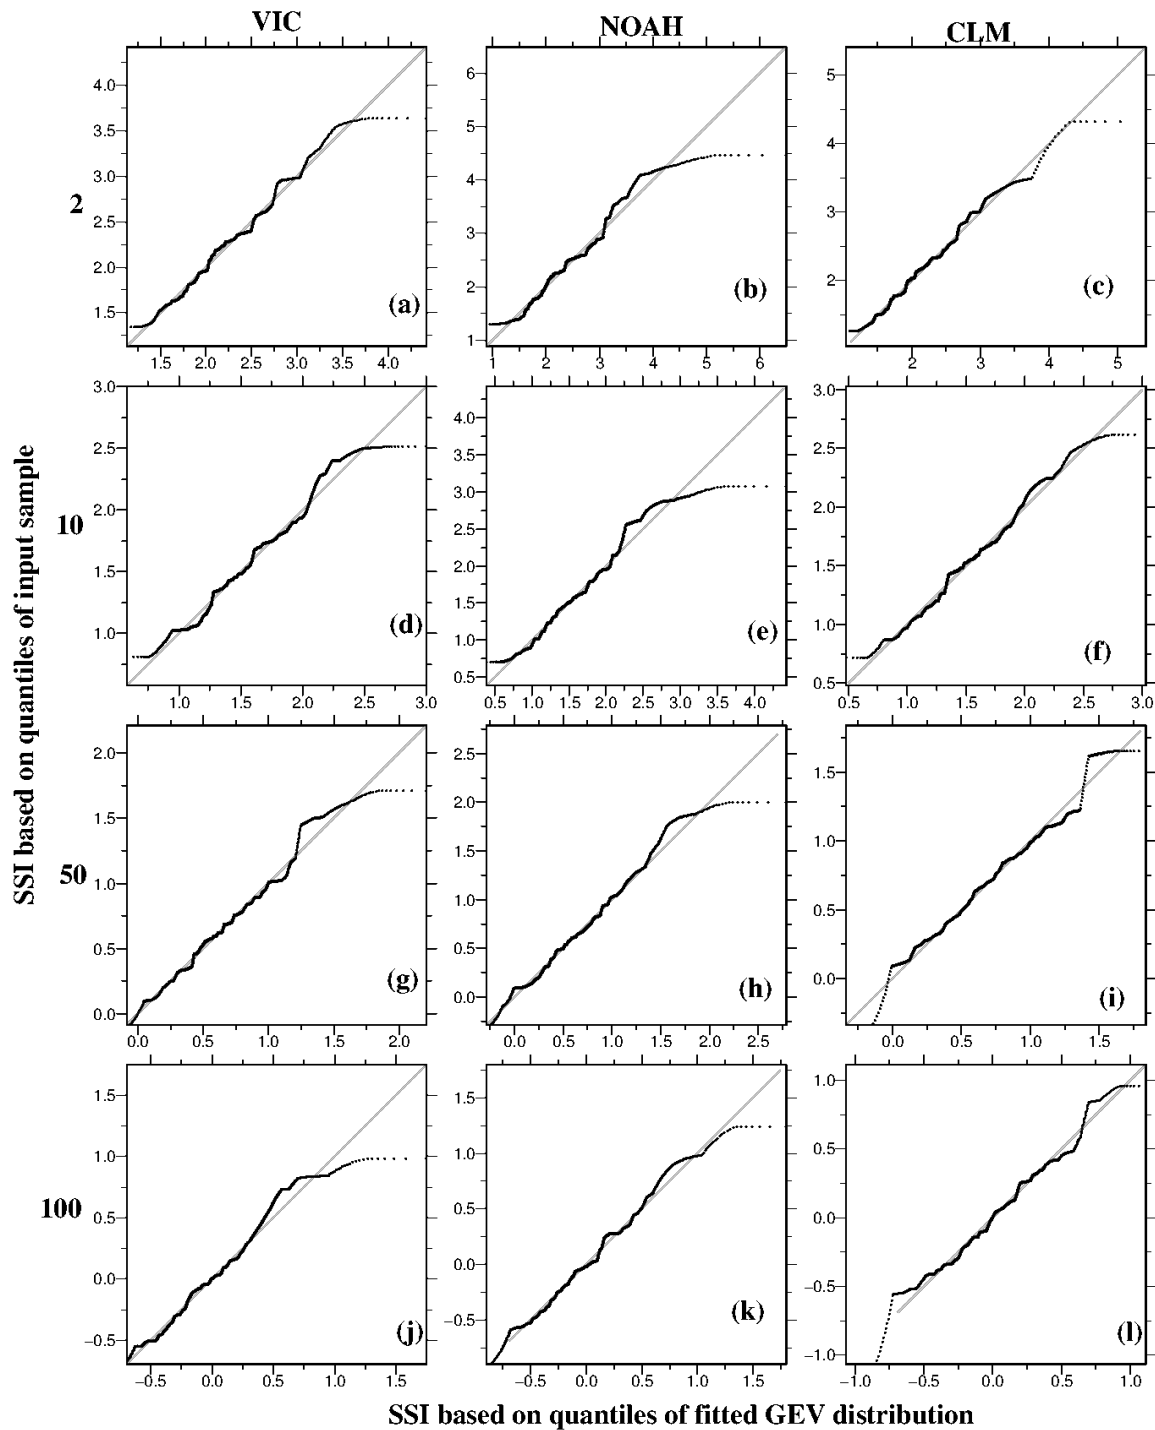

Figure S7: Quantile-quantile plot of the monsoon season SSI for different areal extent (% , written in left) of whole India from the VIC (a,d,g,j), NOAH (b,e,h,k), and CLM (c,f,i,l) and corresponding SSI estimated by fitting GEV distribution to the monsoon season SSI.

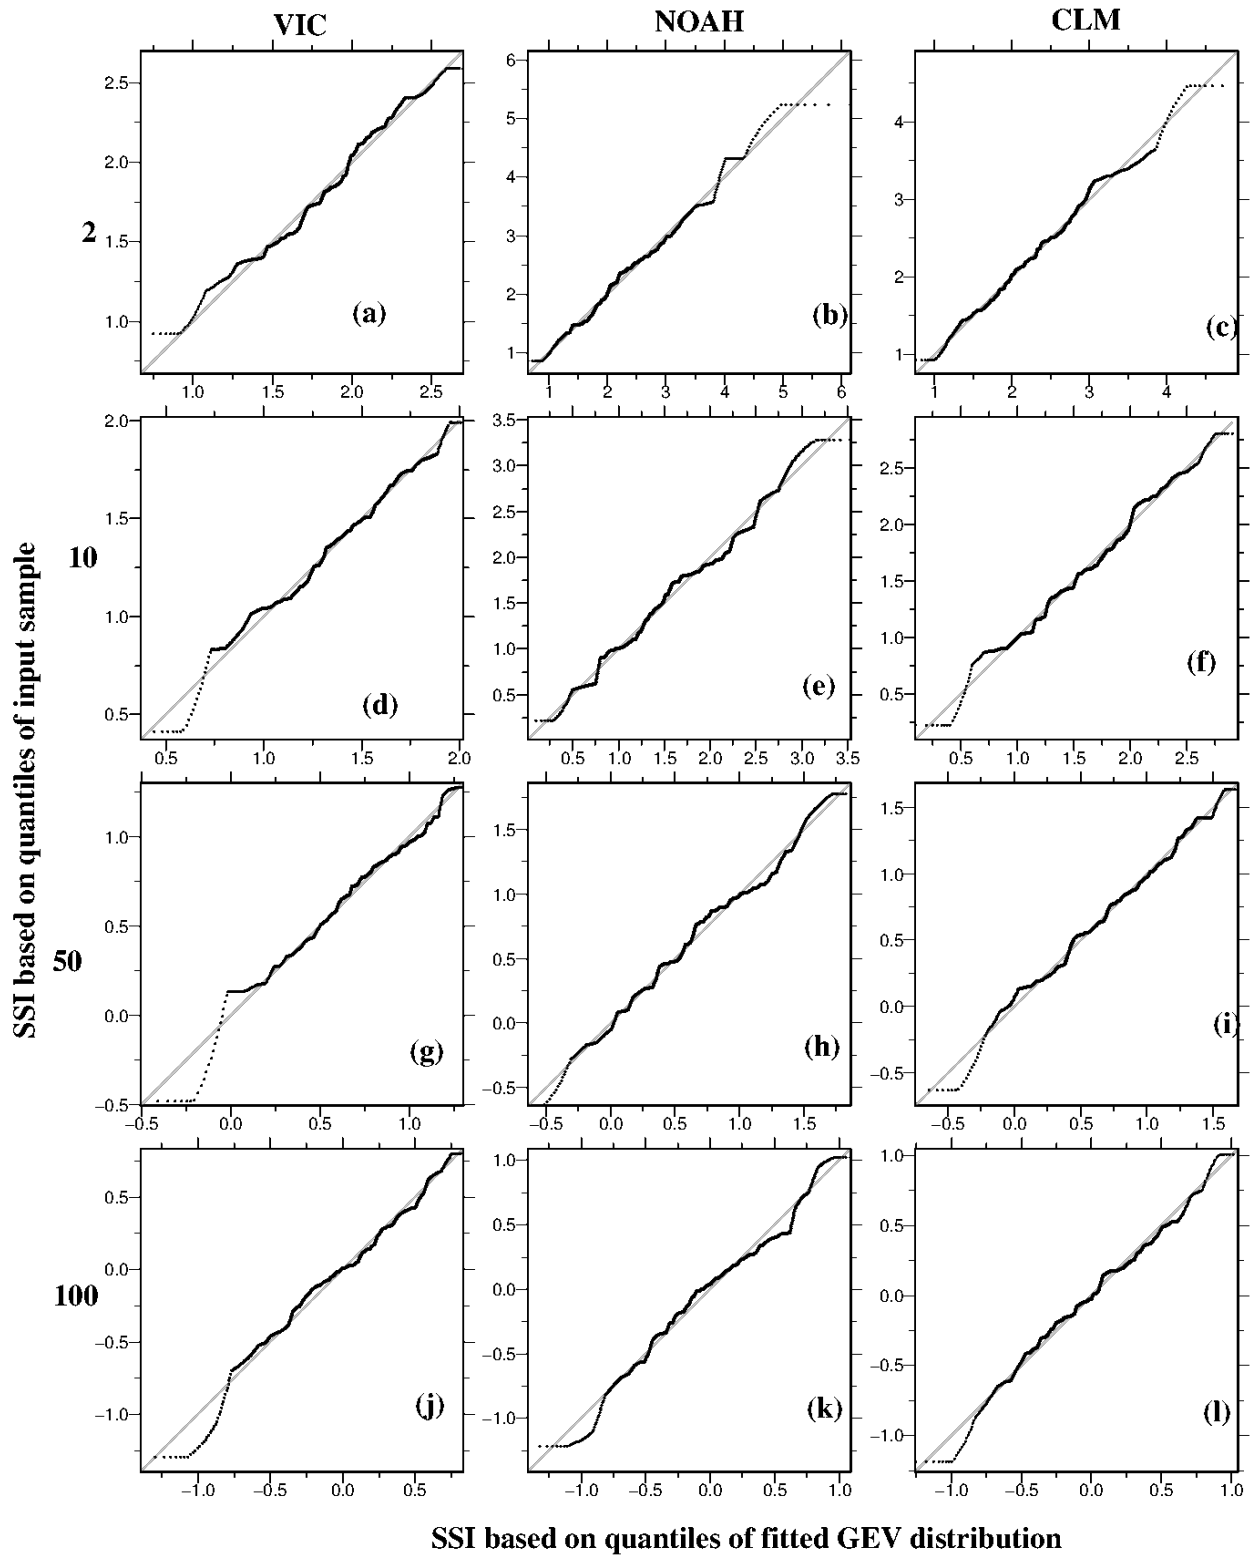

Figure S8: same as Figure S7 but for the Rabi season.

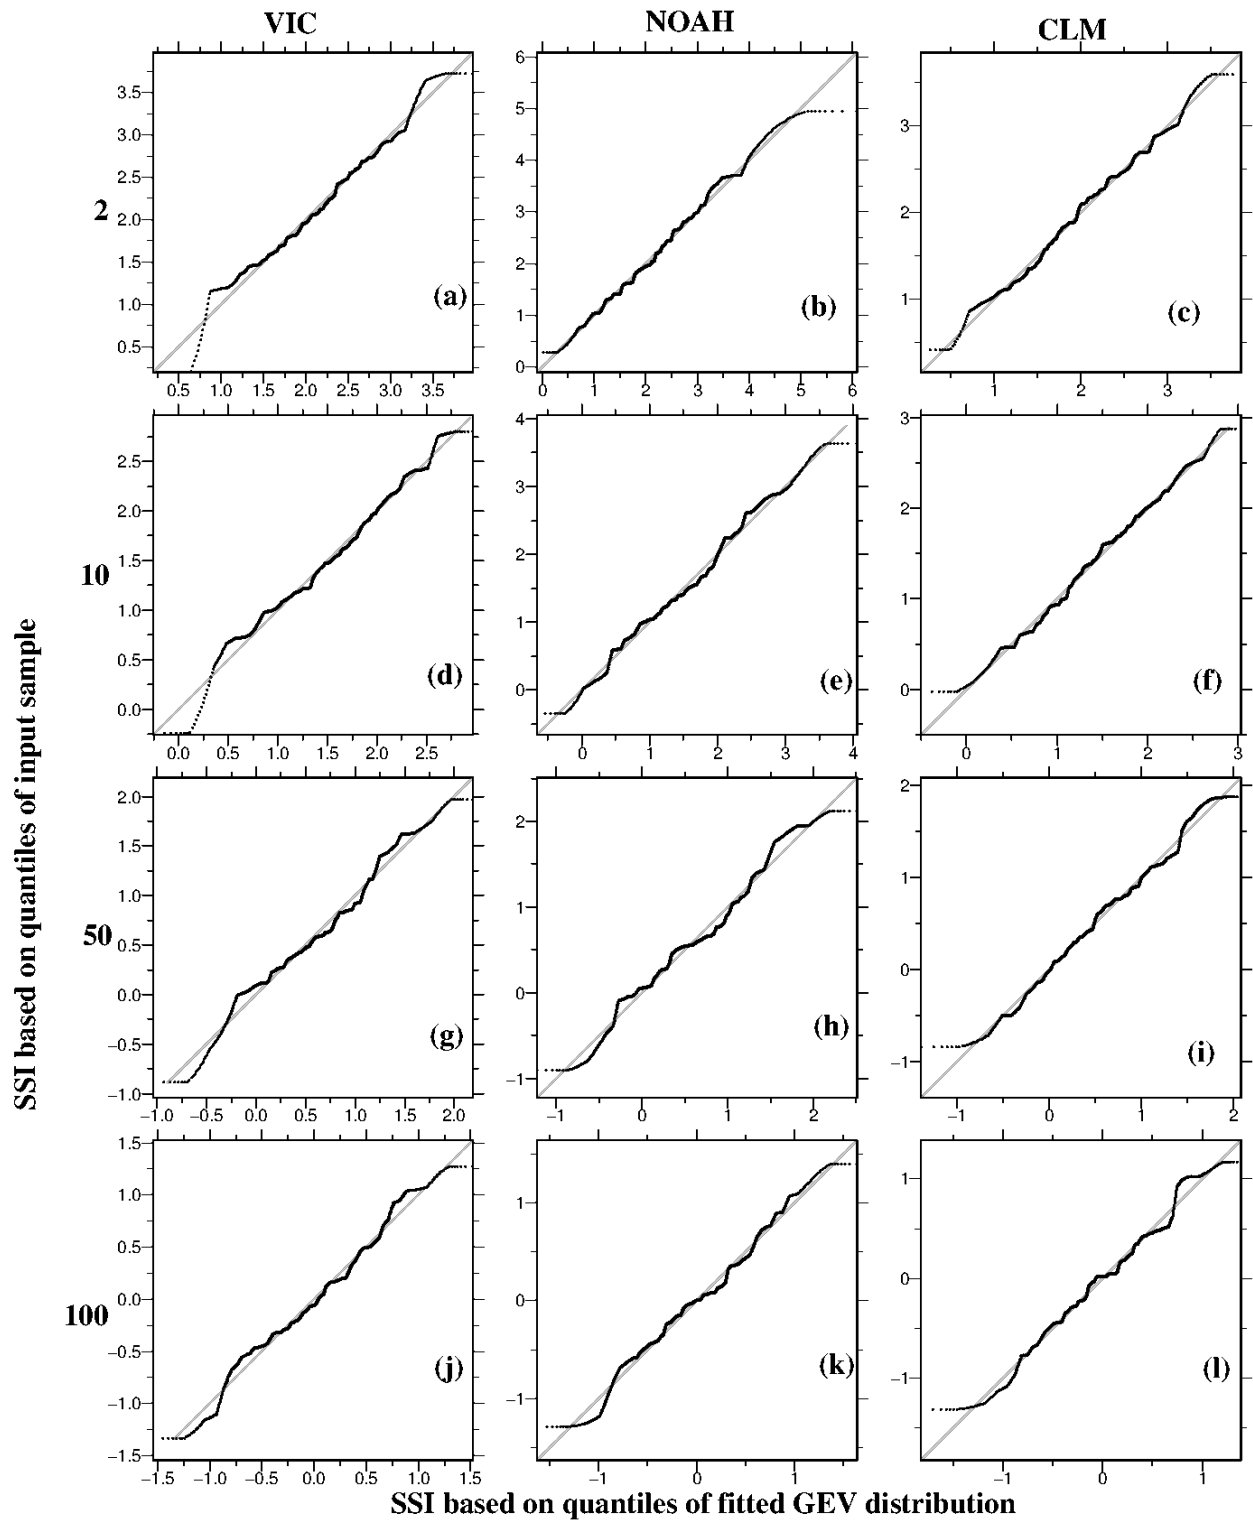

Figure S9: same as Figure S8 but for annual SSI estimated for areal extent of Indo-Gangetic plain.

Table S1: Description of hydrological process and parameters use in all three models.

LSM	Hydrology	Soil Layers	Soil/ vegetation parameters	Input Parameters
VIC v4.2.1.a	Variable Infiltration Capacity curve for runoff, Arno model for Base flow, drainage driven by gravity, Penman-Monteith equation for evapotranspiration (ET)	Three layers	Vegetation parameter based on 1km Advanced Very High Resolution Radiometer (AVHRR), Soil parameter from Harmonized world soil database (HWSD)	Four parameters, Precipitation, Maximum and Minimum air temperatures, and Wind speed
NOAH v3.1	Exponential distribution of infiltration capacity for runoff, baseflow proportional to storage, drainage driven by gravity, Penman-Monteith equation for ET estimation,	Four layers	Modified IGBP MODIS 20-category vegetation, vegetation fraction derived based on Normalized Difference Vegetation Index (NDVI) from AVHRR, Soil parameters derived from FAO.	Precipitation, air temperature, wind speed, surface pressure, humidity, surface downward and longwave radiations.
CLM v3.0	TOPMODEL for surface runoff, groundwater scheme, , Penman-Monteith equation for ET	10 Layers	Vegetation parameters represented for 17 plant functional types (Bonan et al. 2002), soil parameters based on IGBP.	Precipitation, air temperature, specific humidity, incident solar radiation, and surface pressure.

Table S2: Performance of three LSMs (VIC, NOAH, and CLM) in terms of Nash Sutcliffe Efficiency (NS) and correlation coefficient (R) for monthly streamflow simulations compared against observations across 19 gauging stations across India (see Figure S1 for locations of these basins) for calibration and validation periods. Additionally the skill of the ensemble mean streamflow (ENS) from the three LSMs is also provided in this Table.

Table S13: P (at 5% significance level) and h value for goodness of fit-test (chi-square test) performed to test fit of GEV distribution fitted to annual SSI for selected areal extents (%) of drought in Indo-Gangetic plain region. $P > 0.05$ and $h = 0$ indicates that fit-test do not reject the null hypothesis that GEV distribution fits the annual SSI for selected areal extent of drought in Indo-Gangetic plain region.
