Major comments 1. It is well written manuscript with thoroughly analysis. 2. On the other hand, I'd like to question the validity of the simulated changes given the fact the all RCMs underestimate extreme precipitation even in EVAL. Further, this underestimation seems worse in HIST. Can the authors provide quantitative assessment how different in EVAL and HIST? 3. Continued... Can the authors separate one with bet-

C1

ter/worse performance in terms of extreme precipitation? 4. Uncertainty in observation - SAFRAN: In discussion section, the authors provide a bit of confusing message about how good observation dataset is. If there are different high-quality observation datasets, it'd be nice to provide them.

Overall, it is well written and organized paper. However, I hope the questions/comments will be taken care of before its publication.
