Received and published: 21 February 2018

This manuscript deals with extreme floods under climate change in Finland. While this is an interesting and timely issue, the two excellent reviews raised important concerns. Main issues include a not fully up-to-date awareness of recent studies, which besides the incomplete review also (and this is the more important point) seemed to have resulted in the use of somewhat outdated methods. Another issue is that the focus and novel aspects are not fully clear. Here it is important to concentrate on and highlight those parts, which are novel contributions. The selection of the catchments is another point that has been criticized.

C1

The responses of the authors indicate that they are willing and able to revise the manuscript, and if the reviewer comments are taken seriously, I am confident that this can become a valuable contribution for HESS.

Best regards, Jan Seibert
