26 **Figure S1:** Squared wavelet coherence between the AMO and the temporal patterns of drought
 27 (SPEI6_{Apr_Sept} and SPEI12_{Oct_Sept}). Phase arrows pointing right indicate signals are in phase, whereas a left-
 28 pointing arrows indicate an antiphase relationship. Arrows deviating from the horizontal are indicative of
 29 lead-lag relationships between the two signals. The black contour designates the 95% confidence level
 30 against red noise, and the cone of the influence (COI) where edge effects might distort the picture is shown
 31 as a lighter grey shade.

Figure S2: Squared wavelet coherence between the AO and the temporal patterns of drought (SPEI6_{Apr_Sep} and SPEI12_{Oct_Sept}). Phase arrows pointing right indicate signals are in phase, whereas a left-pointing arrows indicate an antiphase relationship. Arrows deviating from the horizontal are indicative of lead-lag relationships between the two signals. The black contour designates the 95% confidence level against red noise, and the cone of the influence (COI) where edge effects might distort the picture is shown as a lighter grey shade.

Figure S3: Squared wavelet coherence between the NAO and the temporal patterns of drought (SPEI6_{Apr_Sep} and SPEI12_{Oct_Sept}). Phase arrows pointing right indicate signals are in phase, whereas a left-pointing arrows indicate an antiphase relationship. Arrows deviating from the horizontal are indicative of lead-lag relationships between the two signals. The black contour designates the 95% confidence level against red noise, and the cone of the influence (COI) where edge effects might distort the picture is shown as a lighter grey shade.
