Very interesting work. Just some minor comments:

(1) You link the landslides to "a sudden drop in Dead Sea level that usually occurs during the dry season". What data exist to support this idea of a sudden drop? Could there be a link to rainfall in the uplands with a time lag related to groundwater flow rate? What about seismic events triggering the landslides?

(2) The conclusion section should include a summary of the main scientific findings of this paper.

C1

With best wishes
