In light of the comments of Referee #2 regarding unit use, we re-considered comment MC3 by referee #1. Accordingly, we now accept the original comment:

MC3: *Concentration units and naming chemicals entities – be consistent in naming and with units. Micro-molar than mg/l and in the N species is it as N or for the molecule?. I suggest use mg/l as C for DOC and mg/l as N for all N species thought the manuscript and say it explicitly. NO₂⁻ is an anion, “ammonium and NO₃⁻”, spell the chemical formula for the ammonium as well.*

Author's response: According to the suggested, we made sure the chemical formula of ammonium is used throughout the text, with a few necessary exceptions in the M&M (i.e. "Ammonium test kit", "Ammonium chloride"). Concentration units of the field data (SHAFDAN) presented in the introduction were converted from μM to mg/L . DOC and TKN analyses are reported in our work in mg/L (of C and N respectively). For NO_3^- and NH_4^+ , we accept that consistent use of units is preferable and hence we now use $\text{NO}_3^- - \text{N}$ and $\text{NH}_4^+ - \text{N}$ in mg/L as was suggested.
