Interactive comment on "Evaporation from a large lowland reservoir – (dis)agreement between evaporation methods at various timescales" *by* Femke A. Jansen and Adriaan J. Teuling

Anonymous Referee #1

Thanks for the authors to address the comments patiently. 1. I agree with the new title. 2. I think Staroven and Lelystad stations should be mention on the new version as well as the explanation and comparison with De Bilt. 3. A brief explanation of the extension of the results for all area should be add, mainly because you are leading with a huge reservoir. 4. Annual inputs and outputs should be mention in the new version. 5. I agree that WST obtained with FLake should not be added.
