1. Evaluation of bias correction methods in a climatological perspective

12

2. Added value of bias correction for extreme precipitation events

13

Tables S1 to S5

14

Figures S1 to S3

15 1. Evaluation of bias correction methods in a climatological perspective

16

Tables S1, S2, S3, and S4 contain the results of the evaluation of the tested bias correction methods
for the Elbe, Oder, Rhine, and Vistula catchments. The results are already discussed in Sect. 4 of the
main paper.

19

2. Added value of bias correction for extreme precipitation events

20

Figure S1 shows the time evolution of the Rhine flood in May 1983. Figures S2 and S3 show the
precipitation pattern for the 1997 and 2002 flooding events. The results are already discussed in
Sect. 5 of the main paper. Table S5 shows the added value of bias correction for the top ten river
floods between 1979 and 2010 for ERA20C-CCLM.

24 **Table S1.** Root mean square error (RMSE), Pearson's correlation coefficients (R) and Taylor's skill
 25 scores (S) for the raw model runs plus for the model runs with different bias corrections just for the
 26 Elbe catchment: linear scaling (LS), local intensity scaling (LOCI), power transformation (PT),
 27 empirical quantile mapping (EQM), and quantile mapping with gamma distribution (GQM). Results
 28 of ERAI-CCLM based on RPI and of ERA20C-CCLM on RPII. Best values of each measure are
 29 print in bold.

34 **Table S5.** Top 10 events of the five investigated river catchments for the time period from 1979 to
 35 2010. The events are identified as the ten highest catchment-averaged 7-day running means of
 36 precipitation from E-OBS. The indicated dates (YYYY-MM-DD) address the timing of the peak
 37 value. Events where bias correction (EQM monthly) do not have an added value and the ERA20C-
 38 CCLM shows large differences towards observations are printed in italic (-) Events which are
 39 already captured well in ERA20C-CCLM, so that bias correction cannot lead to a further
 40 improvement, are printed standard (0). Events where bias correction has an added value are in bold
 41 print (+). The underlined events are very well captured.
