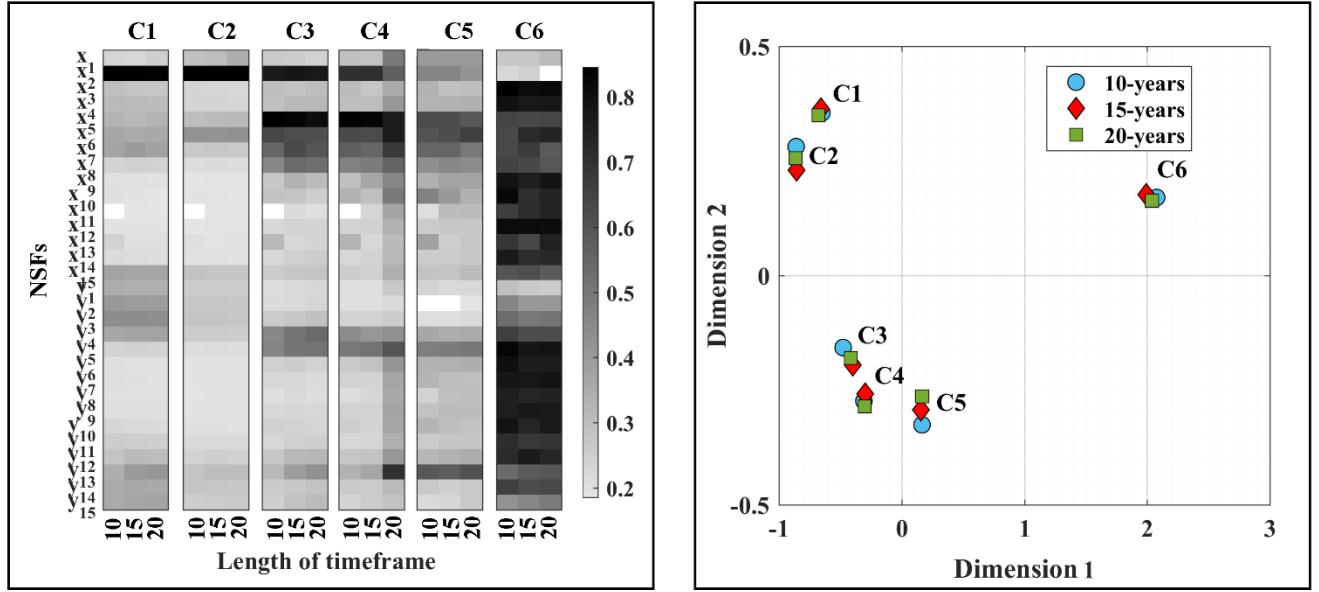

Fig. S1. Cluster centers for 10-, 15- and 20-year timeframes. The left panel shows the variation in cluster centers, i.e. 30 Normalized Streamflow Features (NSFs) with respect to the length of the clustering timeframe. In each sub-panel, columns from left to right correspond to 10-, 15- and 20-year timeframes, respectively. The right panel shows the two dimensional scaling of the cluster centers, which represent the relative distance of cluster centers from one another considering 10-, 15- and 20-year timeframes.

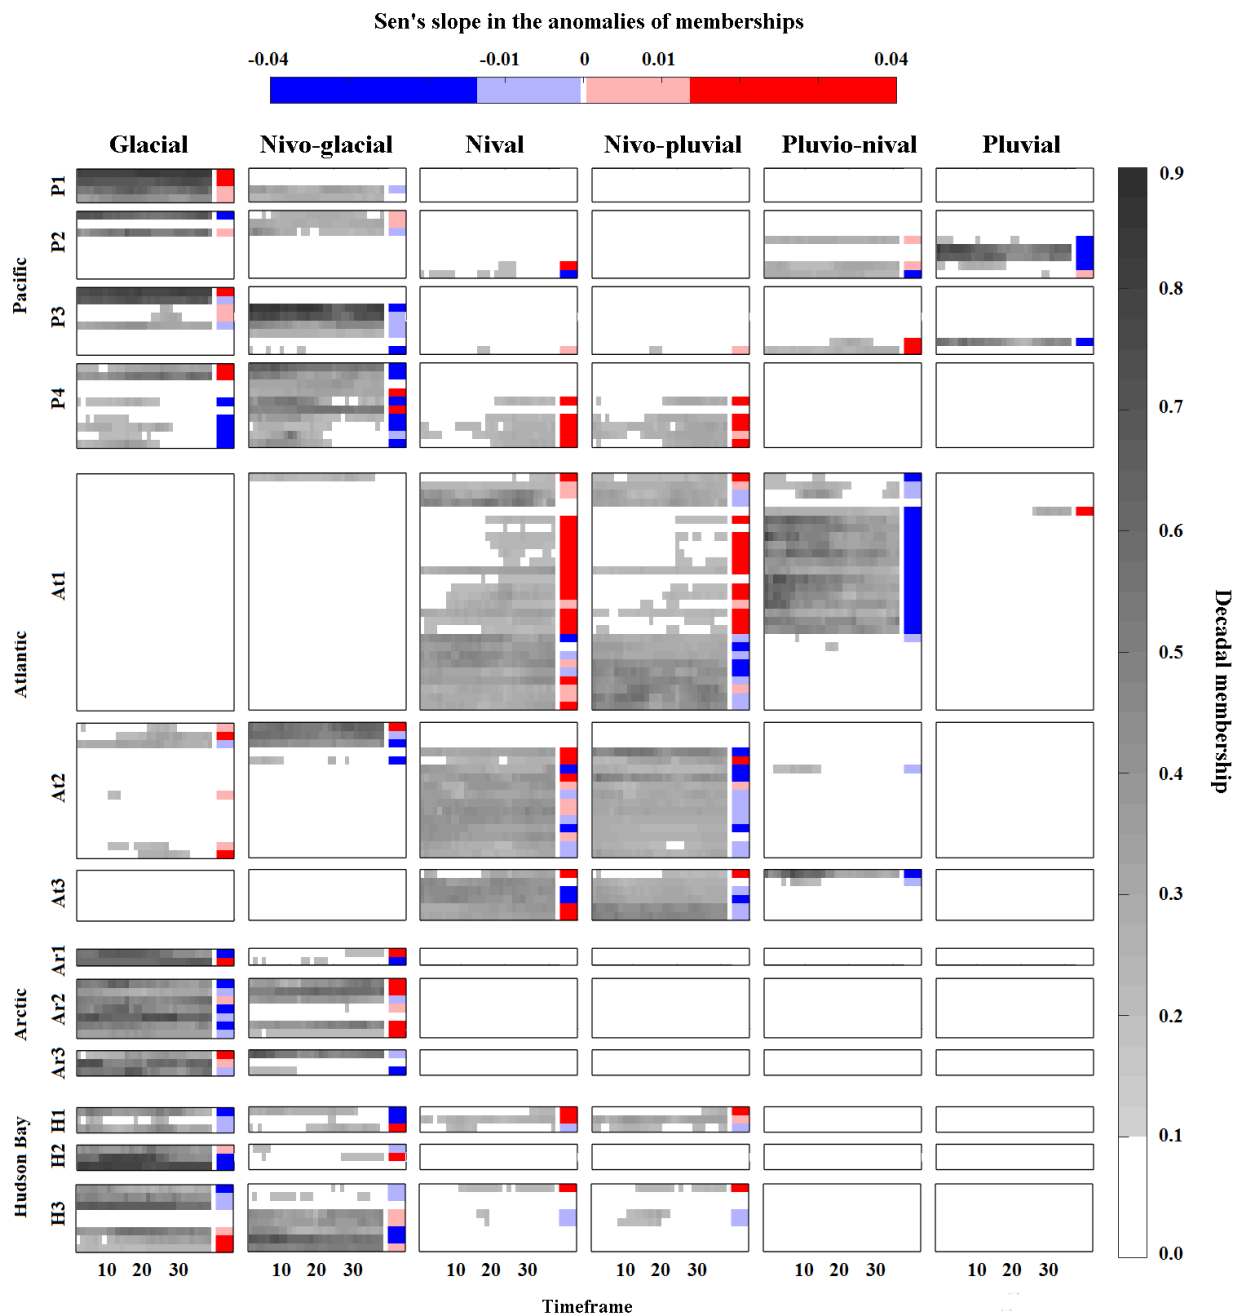

Fig. S2. The evolution in the degrees of membership to each regime type in 106 considered RHBN streams along with the corresponding Sen's slope. For each stream, the shades of grey show decadal memberships over the period of 1966 to 2010 considering a 15-year moving window. The color bar shows the direction and significance of the Sen's slope of the trend in the anomalies of memberships. Positive and negative trends are shown with red and blue colors, respectively. Sharper colors show significant cases.

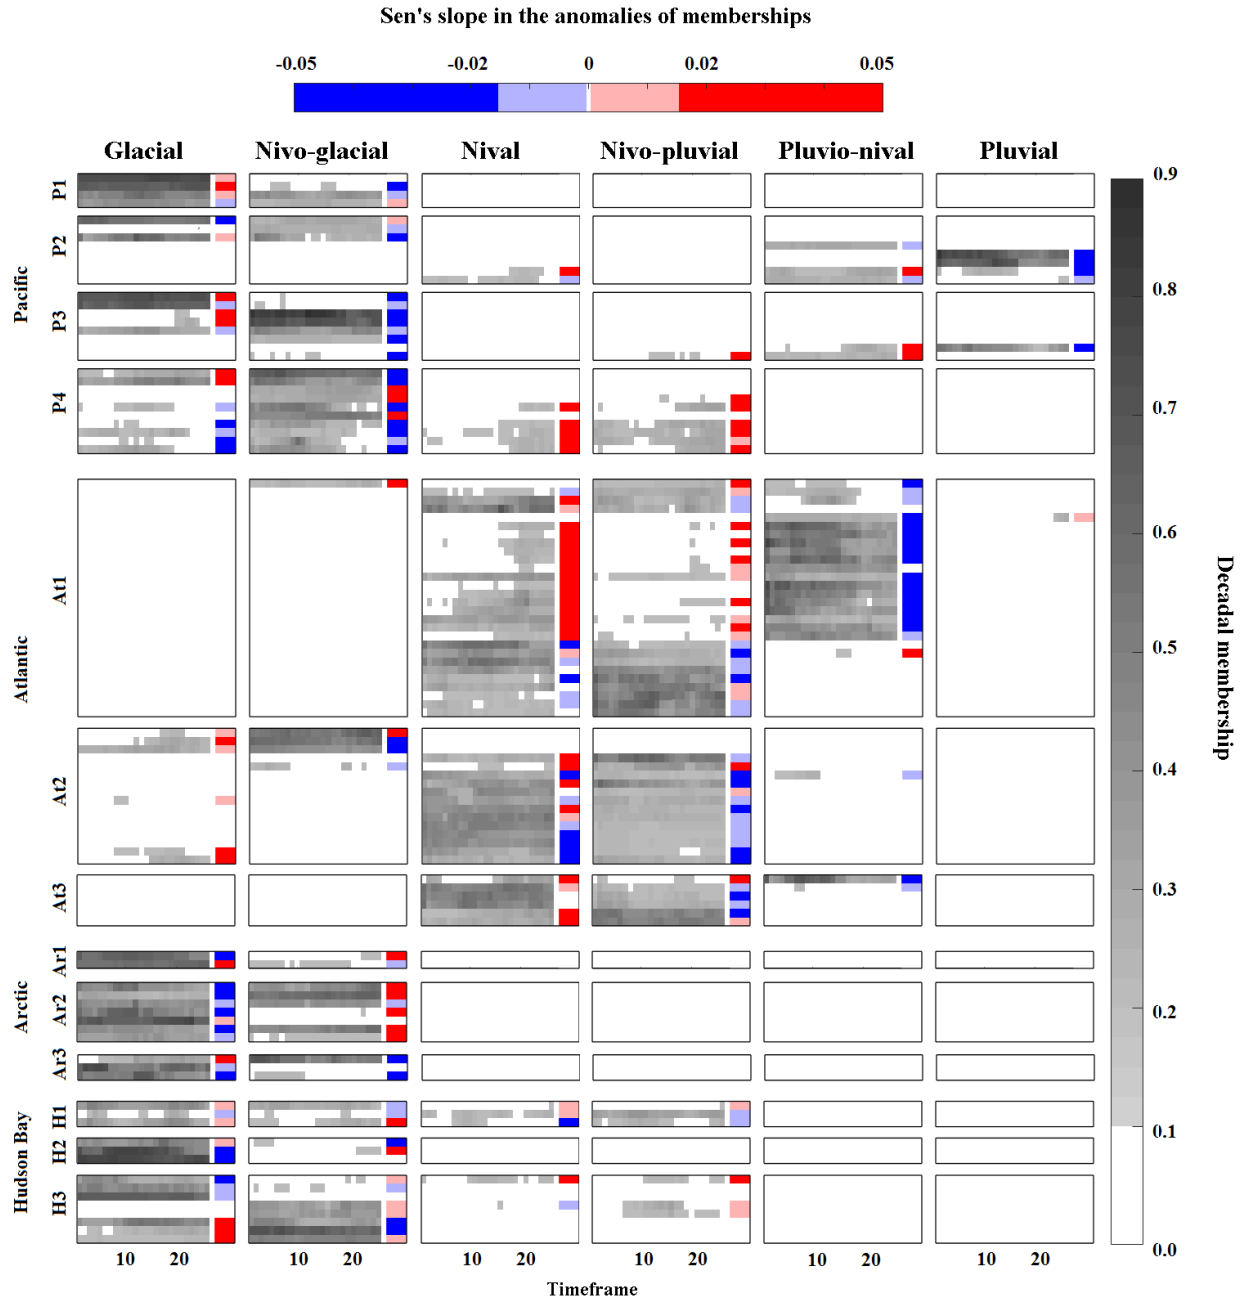

Fig. S3. The evolution in the degrees of membership to each regime type in 106 considered RHBN streams along with the corresponding Sen's slope. For each stream, the shades of grey show decadal memberships over the period of 1966 to 2010 considering a 20-year moving window. The color bar shows the direction and significance of the Sen's slope of the trend in the anomalies of memberships. Positive and negative trends are shown with red and blue colors, respectively. Sharper colors show significant cases.

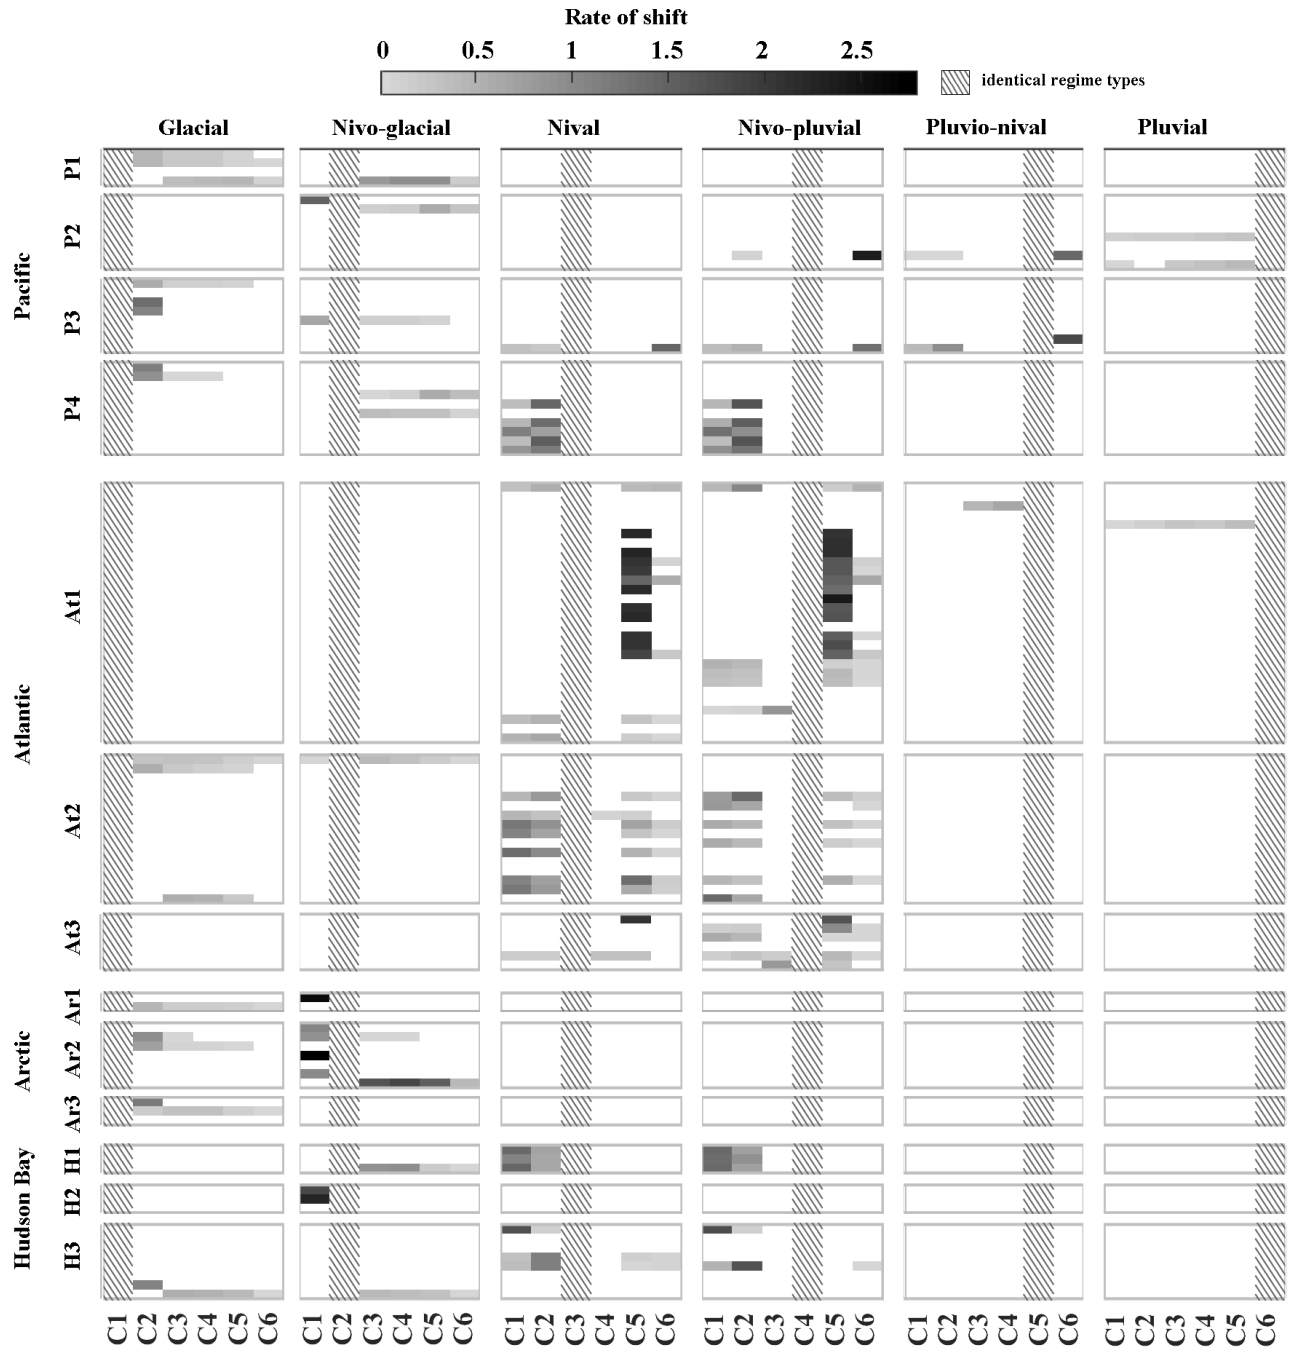

Fig. S4. Mapping shifts in natural streamflow throughout Canada during 1966 to 2010 considering 15-year timeframes. Rates of shift among various regime types in each stream are shown by shades of grey that quantifies how much decline in the giver regimes shown in the x-axes in each panel can result into incline in the receiver regime type corresponding with the column in which the panel is located. Columns filled with diagonal lines show the identical regime types with the receiving regimes identified in the column where the panel is located.

Rates of shift among various regime types in each stream are shown by shades of grey that quantifies how much decline in the giver regimes shown in the x-axes in each panel can result into incline in the receiver regime type corresponding with the column in which the panel is located. Fig. S6. The alterations in regime types for 106 RHBN streams attributed to the first moments of the 15 IHA considered. Shades of red and blue show the positive and negative dependencies between changes in streamflow features and the degrees of membership, respectively. Color saturation shows the coefficient of determination between changes in the streamflow features and the degrees of membership representing the percentage of described variance in changes of streamflow regime by changes in streamflow features. The analysis is related to 15-year timeframes.

Fig. S7. The alterations in regime types for 106 RHBN streams attributed to the second moments of the 15 IHA considered. Shades of red and blue show the positive and negative dependencies between changes in streamflow features and the degrees of membership, respectively. Color saturation shows the coefficient of determination between changes in the streamflow features and the degrees of membership representing the percentage of described variance in changes of streamflow regime by changes in streamflow features. The analysis is related to 15-year timeframes.
