I. Relationship between Porporato's parameter ω and Chourhury's parameter n

Supplementary Figure S1 Relationship between Porporato's parameter ω and Chourhury's parameter n . The black solid curve represents the best fit relationship ($R^2=0.96$, $p<0.001$) provided by the equation given on the figure.

II. Global pattern of effective rooting depth

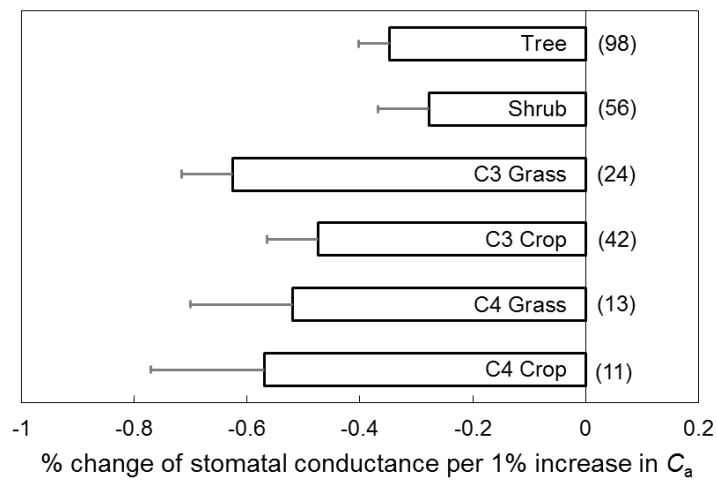

We estimated the effective rooting depth (Z_e) using an analytical carbon cost-benefit model based on ecosystem optimality theory (4). The climatological mean Z_e during 1982-2010 is shown in Supplementary Figure S2.

Supplementary Figure S2 Global pattern of mean annual effective rooting depth over 1982-2010.

V. Response of stomatal conductance to eCO₂

The response of stomatal conductance (C_s) to eCO₂ was determined using meta-analysis based on observations collected from 244 field experiments as summarized in *Ainsworth and Rogers (5)*. As the magnitude of eCO₂ varies in these 244 experiments, we obtained the sensitivity of C_s to eCO₂ (percentage change in C_s per 1% increase in C_a) using linear interpolation. We then classified the 244 observations based on their biome type to construct a biome type-based look-up table of C_s sensitivity to eCO₂ (Supplementary Figure S3).

Supplementary Figure S3 Sensitivity of leaf-level stomatal conductance to eCO₂.

Numbers in the brackets indicate the number of observations in each biome type.

Error bars represent one standard deviation among individual observations.

VIII. Sensitivity of Q to $e\text{CO}_2$, P and E_P

In addition to showing the relative sensitivity of Q to $e\text{CO}_2$, P and E_P in the main text (Figure 7), here we also show the absolute sensitivity of Q to $e\text{CO}_2$, P and E_P (Supplementary Figure S4). Similar to the relative values, the absolute sensitivity of Q to $e\text{CO}_2$ is higher in dry regions and lower in wet areas (Supplementary Figure S8a). Regarding the absolute sensitivity of Q to P and E_P , both show a higher value in wet regions and smaller value in dry areas (Supplementary Figure S4b and c).

Supplementary Figure S4 Spatial distribution of the absolute sensitivity of Q to (a) $e\text{CO}_2$, (b) P and (c) E_P .

IX. Literature review of observed plant root characteristics in response to eCO₂

In the current study, we modeled the response of effective rooting depth (Z_e) to eCO₂ and found that Z_e increases with eCO₂ across the majority of global terrestrial ecosystems. However, it is impossible to directly validate our modeling result with field observations, as it is impossible to measure rooting depth across large regions. Here, we collected measured response of plant rooting characteristics (i.e., rooting depth and root biomass) to eCO₂ from 97 published observations (Supplementary Tables S1 and S2). Among these 97 observations, 86 (88.7%) reported an increased root length and/or root biomass as C_a rises. This is in consistent with our modeling results that eCO₂ generally increases the effective rooting depth (i.e., more roots, either in length or biomass). Since there is currently no large scale observations of rooting depth in response to eCO₂, the Supplementary Tables S1 and S2 provide an indirect, yet best available observational support for our modeling results.

Supplementary Table S1 Observed percentage changes (mean \pm 1 standard deviation) in root characteristics (Δ root) in response to eCO₂. n is the number of observations and numbers in the brackets under column n indicates the number of observations showing increased root characteristics in response to eCO₂.

Root characteristics	Free-Air CO ₂ Enrichment			Open Top Chamber / Glasshouse		
	<i>N</i>	eCO ₂ (%)	Δ root (%)	n	eCO ₂ (%)	Δ root (%)
Total root Biomass	28 (26)	+52.6 \pm 7.0	+34.6 \pm 32.7	36 (32)	+91.3 \pm 18.3	+38.0 \pm 48.6
Total root length	1 (1)	+76.5	+38.8	3 (3)	+90.7 \pm 6.9	+33.3 \pm 12.5
Fine root biomass	24 (22)	+52.6 \pm 8.6	+52.6 \pm 35.4	15 (14)	+80.0 \pm 25.8	+57.5 \pm 52.1
Fine root length	4 (3)	+44.0 \pm 7.6	+14.7 \pm 11.3	3 (3)	+98.4 \pm 1.5	+96.8 \pm 74.4

1 **Supplementary Table S2** Summary of observed root characteristics in response to elevation in atmospheric CO₂ concentration. *a*CO₂ in the
2 ambient CO₂ concentration (ppm) and *e*CO₂ in the elevated CO₂ concentration (ppm). DRB is the dry root biomass; TRL is the total root length;
3 DFRB is the dry fine root biomass; FRL is the fine root length. In the Method column, FACE represents Free-Air CO₂ Enrichment, OTC stands
4 for open-top chamber and GH indicates glasshouse. Superscript 1 indicates root biomass in g m⁻², superscript 2 indicates root biomass in g per
5 experimental unit, superscript 3 indicates root biomass in g per plant, superscript 4 indicates root length in mm cm⁻², superscript 5 indicates root
6 length in m per plant. NR means not reported.
