

Interactive comment on “AI-based techniques for multi-step streamflow forecasts: Application for multi-objective reservoir operation optimization and performance assessment” by Yuxue Guo et al.

Anonymous Referee #2

Received and published: 5 March 2021

The authors proposed a stochastic analysis based on AI for water resources optimization and localization. The paper is fully in the aims of the Journal and it is well written, well-structured and characterized by adequate language. I have a simple observation: - In Figure 5, deterministic S5 performance indicators overlap each other, I would suggest to modify color or width to improve the readability.
