Thank you very much on comprehensive comments that we include in the our paper. We add additional text of few pages and conclusion in manuscript. In addition, we involve new coauthor in revised manuscript. Our respond is in the revised manuscript.

3) I am surprised that you did not mentioned the International commission for the protection of the Danube river (ICPDR) and its working group on hydrology and flood (but also the work of the ICPDR linked to climate change). It seems to me that the ICPDR is nowadays a major cooperation actor for the Danube river basin. If any it would be interesting to state in your article what are the links between the two cooperation platforms, if there are exchanging or using each others products/data, how are they exchanging

C1

(common person, meetñings, ...), ... I think one paragraph on this aspects could be beneficial to the article.

There is no working group on hydrology in ICPDR. ICPDR main task is protection of environment, water quality, ecology, biodiversity. We present on the official meeting of ICPDR as observer and invite secretariat of ICPDR on our meetings also. They have not so much interest on hydrology; there is connection on ICPDR web from on item “Water regime” on UNESCO IHP pages, but there is no information about. The ICPDR has not so much interest and funding for hydrology. By the way, I was ICPDR task force member before ICPDR was establish.
