Abstract. Management of transboundary rivers will be one of the great political and environmental challenges of the 21st 8 9 century if knowledge of conflict and cooperation is not fully developed. Transboundary river conflict and cooperation are 10 critical for the sustainable development of river basins, regional security, and stability, and have significant scientific and practical implications. The construction of a dataset of transboundary water events – individual conflictive or cooperative 11 12 interaction between riparian -provides important data support and factual basis for the study of transboundary rivers. However, 13 the most representative research, the Transboundary Freshwater Dispute Database, is built by means of manual reading for 14 information extraction, thus difficult for fast updating, also does not cover the global changes in the past decade. This research 15 aims to build a methodological framework for news media datasets tracking of conflict and cooperation dynamics on 16 transboundary rivers, provide mass of relevant data for the research of transboundary rivers in the globe, prepare a potent 17 research toolkit, lay a solid foundation for further data mining research, and better suit the big data age. In order to test the 18 effectiveness of the methodological framework and toolkit for dataset construction, this research analyses the spatial coverage 19 both in terms of continental and national, temporal coverage from 1953 to 2019, content coverage and conducts relevance 20 screening of the articles in the four representative river basins in the datasets. The results show that the datasets built by this 21 framework can capture comprehensive contents of transboundary water conflict and cooperation in both spatial and temporal 22 coverage with acceptable data quality.

23 **1 Introduction**

Globally, there are 310 transboundary river basins, covering 47.1% of the land area except Antarctica (McCracken & Wolf, 2019), and accounting for approximately 60% of global freshwater discharge (Wolf et al., 1999). The population of the basins 26 comprises 52% of the world's total (McCracken & Wolf, 2019). Transboundary river basins not only support the lives of the 27 people in the basins, but also connect the various economic sectors and ecosystems in the basin into an organic whole; 28 transboundary water management not only affects the development of riparian countries in all aspects, but also intertwines 29 social, economic, environmental, and political sectors of each riparian country and increase interdependence in between (United Nations, 2019). Riparian countries have divergent demands and priorities for transboundary water resources, different development agendas for water resources, and different water governance regimes and water resources cultures (Sadoff & Grey, 2005), which make the management of transboundary water resources more complex than that of domestic water resources. Transboundary river basins are thus prone to conflicts of various forms, forming a complex situation where conflicts and cooperation develop intertwined. Therefore, research on water conflict and cooperation in transboundary rivers has important theoretical value and practical significance. Exploration of dynamics of conflict and cooperation as social sectors in a human-water coupled transboundary system is especially prominent.

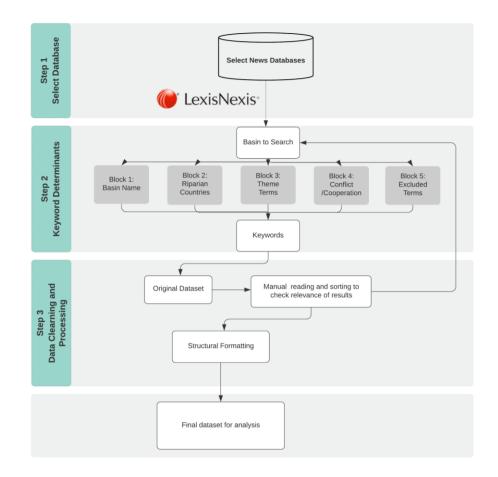

37 Among the extant studies on transboundary rivers, transboundary water event datasets - individual conflictive or cooperative 38 interactions between riparian – provide factual data support for the formation of global generalized understanding, which is of 39 great significance. The most representative research - Transboundary Freshwater Dispute Database (TFDD) developed by 40 Oregon State University (Wolf, 1999) has compiled more than 6,400 historical transboundary water events, both conflictive 41 and cooperative (3813 left after removing duplicated records by us from their original data) on the global scale from the year 42 of 1948 to 2008 (Transboundary Freshwater Dispute Database, 2008). The data came from existing political science datasets 43 and news media articles, which was manually screened, interpreted, and coded to extract the detailed information of the water 44 event (Yoffe & Larson, 2001). Building upon these event data, Basin at Risk Projects (BAR) (Yoffe & Larson, 2001) further 45 classified water events by level of intensity of conflict or cooperation, ranging from -7 to +7 to identify potential socio-political 46 threats, and provided a brief summary of the detailed information of the event. The results included very few examples of full 47 cooperation and extreme conflicts but identified river basins that are at potential risk for further conflict. TFDD has built up 48 foundation of this methodological framework for tracking transboundary river water events and allows for further identification 49 of the conflict/cooperation dynamics and possible analysis of its complex driving mechanism.

50 Given that manual reading and coding processes was adopted in TFDD, which largely limit the implication of this method in 51 the era of big data. The explosion of digital news data, whose discussion of transboundary water events has grown 52 exponentially, made it more difficult to manually track all published water events and the dynamics of conflict and cooperation. 53 While manual reading excels in extracting latent and detailed content, it is much more time and labor consuming. Therefore, 54 it is necessary to revise the methodological framework to meet the current need for a more comprehensive and detailed dataset 55 which can be updated in a more efficient manner. Meanwhile it can also provide the basis for further analysis, i.e. to reflect 56 the concerns of different stakeholders, obtain a global law of transboundary water conflict and cooperation (Bernauer & 57 Böhmelt, 2020).

This paper aims to provide such a revised methodological framework for news media tracking of conflict and cooperation dynamics on transboundary rivers and provide a toolkit when applying the framework in the corresponding research. The theory that inspired our framework is from Lasswell's model of communication (Lasswell, 1948), who focused on communication as a process, to conduct problem-oriented inquiry of the news report through content analysis with the seven fundamental elements "who, with what intentions, in what situations, with what assets, using what strategies, reaches what audiences, with what result?". Our design of search keywords generator follows closely to the line of theoretical principles by Lasswell and intends to track conflict and cooperation dynamics on transboundary rivers by answering Lasswell' question involved with seven elements. This study can help to reveal the evolutionary dynamics and patterns of transboundary water conflicts and cooperation on a global scale, collecting news media datasets with an automated approach, and minimizing the manual workload of screening, reading and understanding the relevant news media articles, and provides researchers with powerful tools to retrieve useful information in related fields. It can serve as the foundation for further analysis via text mining and as a methodological foundation of quantifying the social dimension of transboundary river systems.

70 2 Data and Method

71 This study attempts to build a revised methodological framework that reflects the dynamics of water conflicts and cooperation 72 among all the transboundary rivers in the globe. Overall procedures in the revised framework are illustrated in Figure 1. The 73 method can be divided into three steps: Step 1 Select Database, Step 2 Keyword Determinants, Step 3 Data Cleaning and 74 Processing. More specifically, the method begins with selecting news database in Step 1, detailed criteria to select news 75 databases is stated in Sect. 2.1.1. Search keywords are generated in Step 2 with 5 blocks of keywords determinants. These 5 76 blocks concern with river basin characteristics and the research question and determine the validity and relevance of the data 77 to be collected. Using generated keyword in Step 2, original dataset is downloaded for data cleaning and processing in Step 3, 78 which include rough manual reading and sorting to check results relevance in order to feedback on further keywords 79 modification in Step 2. Trial-and-errors between Step 2 and Step 3 promise satisfactory keywords setting for the research. In 80 Sect.2.4, several potentials for analysis in the future are introduced, which are extended applications for this methodological 81 framework.

82

83

Figure 1. Method flow chart

84 2.1 Step 1: Select Database2.1.1 News Media as Data Source

85 Choice of media sources should accord closely with the research goal. Our research goal is to track conflict and cooperation dynamics on transboundary rivers, which requires the data to cover water events and public opinion in a relatively long period 86 87 of time. Also, newspapers (both print news and web news) published by professional journalists and editors are more suitable 88 to use as data sources to reflect opinions of communities than social media (e.g., Twitter) as reflections of individual opinions. 89 News media reflect what is important for the individual country/sector they are published within (Cooper, 2005), it thus has 90 increasingly been studied by researchers to gain insight into transboundary water issues. The local news media is the first-hand 91 material that reflect attitude/perception riparian countries held for their shared water and the involved stakeholders when 92 discussing the water events in the transboundary river basin. In parallel, international news media serve as a good source of 93 information to understand viewpoints from international audience that are outside of the river basins. Together, text analysis 94 of both regional and international news for water events in transboundary rivers can reveal the full picture of the ongoing

95 dynamics in the river basin.

96 2.1.2 Select News Database

97 The very first step of this method involve selecting a news database that covers comprehensive news sources spanning across 98 the globe. The selected media databases should include longitudinal coverage (i.e., can be traced back to decades) and updated 99 in a timely manner, such as Lexis Advance (a product of Lexis Nexis Corporation), ProQuest, Factiva, etc. Lexis Advance 100 covers more than 6,000 mainstream news media in most countries and regions around the world with a long-term coverage, 101 and is one of the most commonly used news sources in the field of social sciences (Weaver & Bimber, 2008; Racine et al., 102 2010). Therefore, Lexis Advance is taken as an example of news media database to demonstrate the process of obtaining news 103 media data of transboundary water conflicts and cooperation, and other suitable databases can, of course, be feasible options. 104 Although the temporal coverage is affected by the level of media development in different regions, the covered timeframe 105 spans over one hundred years to date, providing good data support on tracking media coverage of transboundary water conflict 106 and cooperation research. The scope of research limit to English newspaper only due to our limitation of language processing, 107 which is considered as sufficient enough to meets the requirements for extensive coverage of transboundary water conflicts 108 and cooperative research.

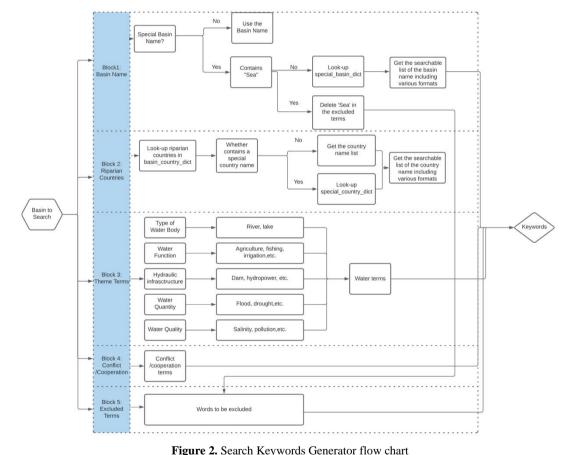

109 2.2 Step 2: Keyword Determinants

110 2.2.1 Select Rivers to Search

111 The scope of rivers to search in this study are 286 transboundary rivers as identified in 2016 (Transboundary Waters 112 Assessment Programme, 2016). It is understood that the total number of transboundary rivers are recently been updated to 310 113 (McCracken & Wolf, 2019), which are due to advancement of remote-sensing technology. Remote sensing can examine the 114 two fundamental characteristics of transboundary rivers (common terminus and perennial), thus finer resolution of hydrologic 115 data assists in discovering new transboundary rivers. In general, majority of the 24 newly added basins are small in area (less 116 than 10,000 km2) (McCracken & Wolf, 2019), and are considered as inactive in conflicts and cooperation dynamics. Therefore, 117 this study holds on 286 transboundary rivers in the procedure of Select Rivers to Search, which can be extended to 310 in the 118 future. Four river basins were taken as case studies, Mekong, Nile, Columbia, and Ganges-Brahmaputra-Meghna (hereafter as 119 GBM) as the global hotspot of water events.

120 2.2.2 Search Keywords Generator

The search terms are one of the key determinants of the coverage and relevance of the data to be retrieved. This study develops a keyword generator that allow efficient generating of keywords terms, which are applicable to all transboundary river basins (286 rivers basins) in the world. The keyword determinants are developed on the basis of TFDD (Yoffe & Larson, 2001) and 124 further revised to include five blocks of terms (as shown in Figure 2). These five blocks aim to include in which river basin 125 (Block 1), who (riparian countries, Block 2), regarding what issues (Block 3), have resulted in Conflict/Cooperation status 126 (Block 4). More specifically, Block 1 and Block 2 are basic information about the river basin, such as name of the river basin, 127 and various formats of riparian countries' names, retrieved articles need to discuss the conflictive or cooperative aspects of the 128 events involving at least one of riparian countries; Block 3 contains theme terms regarding of various functions of the water 129 body, topics discussing hydraulic infrastructure, water quality, agriculture/fishing, or any other specific topics with associated 130 terms; Block 4 include keywords indicate conflict or cooperation; and Block 5 consist of keywords to be excluded which bring 131 in irrelevance. The above five blocks can narrow down the search to the desired scope, with the list of unwanted words further 132 screen out irrelevant topics, after which, the search results can achieve a balance between coverage and relevance, that is, 133 neither too much relevant information is missed, nor too much irrelevant information is included.

134 135

136 (1) Block 1: Basin Name

137 This study customizes relatively general algorithms to generate search strings for river basins with different attributes and 138 conducts special treatments for individual river basins, so that each river basin is under the general search rules resulting in a

- considerable number of search results with a balance of coverage and accuracy. The aim of *Block 1* is to get the searchable list of the basin name including various formats and consider special treatments for specific categories of basin names. There are several categories identified for different variations of basin names, see below for specific information.
- 142 Basin name same as the name of a certain riparian country or state; the search results are likely to contain many articles a) 143 about the internal affairs and diplomacy of the country or state. The detailed list of this type of basins is shown in Table 144 1. When talking about transboundary water issues, people usually focus on interactions on the scale of local communities 145 and riparian states rather than intercontinental, and do not refer to the Continent names. Therefore, raising the frequency 146 of continent name in search keywords will only compress data volume of relevant articles significantly, but not improve 147 the data relevance pertaining to the research goal. However, river basins with the same names but located in different 148 continents have different riparian countries. Adding frequency setting of riparian countries will filter out articles about 149 the river on the other continent effectively. For example, St. John rivers appear both in Africa (flowing through 150 Côted'Ivoire, Guinea, and Liberia) and North America (flowing through the United States and Canada). Rising frequency 151 of riparian countries rather than continent names contributes more to the data relevance.
- b) Basin name contains commonly used words, for example, Amazon, which not only refers to the Amazon river basin, but
 also an e-commerce company in the United States. More filters will be adopted in this case to ensure relevance rate. See
 Table 1 for a detailed list of this type of river basins.
- c) Basin name contains words such as 'Lake' or 'Sea', the word frequency setting for 'River' in the search string needs to
 be modified, and that for 'Lake' needs to be increased, or 'Sea' needs to be removed from the list of noise keyword. See
 the detailed list of this type of river basin in Table 1.
- d) Other categories of basin names that require special treatment (see Table 1 for details) are: river basins have different names, such as upstream and downstream rivers are designated with different names, or the river basin contains multiple rivers; rivers in the basin have different names; the basin name is composed of multiple words; similar basin names exist on different continents; the basin name contains 'St.', but may be referred as 'Saint' in media articles.
- 162

 Table 1. Categories of basins need special treatment

Categories of	Basin names	Treatment
basins need special		
treatment		
Basin name includes	Belize; Columbia; Congo/Zaire; Corredores/Colorado; Gambia; Jordan; La	Raise the frequency setting for 'water' or 'river'
state's or district's	Plata ; Mississippi ; Nelson-Saskatchewan ; Niger ; Senegal ; Tigris-	etc. to filter out the geopolitical articles as many
name	Euphrates/Shatt al Arab	
Basin name includes	Amazon; Baker; Columbia; Cross; Don; Fly; Han; Lagoon Mirim; Lotagipi	Raise the frequency setting for 'water' or 'river'
common word	Swamp; Massacre; Negro; Oral/Ural; Orange; Rhone; Red/Song Hong; San	etc. to filter out water-unrelated articles as many;
	Martin; Seno Union/Serrano; Vanimo-Green; Whiting	or delete a certain percentage of articles from the
		end of the results list
Basin name includes	Lake Chad; Lake Fagnano; Lake Natron; Lake Prespa; Lake Titicaca-Poopo System;	The word frequency setting for 'River' in the
'Lake', 'Sea'	Lake Turkana; Lake Ubsa-Nur; Aral Sea	search string needs to be modified, and that for

		'Lake' needs to be increased, or 'Sea' needs to be
		removed from the list of noise keywords
Basin name includes	Asi/Orontes; BahuKalat/Rudkhanehye; Bei Jiang/Hsi; Benito/Ntem; Ca/Song-Koi;	Contain all formats of related basin/river names in
multiple formats	Cancoso/Lauca; Carmen Silva/Chico; Coco/Segovia; Congo/Zaire;	the search keywords
(maybe consists of	Corantijn/Courantyne; Corredores/Colorado; Cuvelai/Etosha; Douro/Duero;	
multiple rivers)	Gallegos/Chico; Ganges-Brahmaputra -Meghna; Hamun-i-Mashkel/Rakshan;	
	Hari/Harirud; Ili/Kunes He; Jenisej/Yenisey; Juba-Shibeli; Kura-Araks; Lava/Pregel;	
	Mana-Morro; Nelson-Saskatchewan; Oder/Odra; Oiapoque/Oyupock; Oral/Ural;	
	Red/Song Hong; Seno Union/Serrano; Shu/Chu; Tagus/Tejo; Tigris-Euphrates/Shatt	
	al Arab; Tjeroaka-Wanggoe; Torne/Tornealven; Vanimo-Green; Vistula/Wista	
Basin name consists	Muhuri (aka Little Feni)	Contain all formats of related river names in the
a river with multiple		search keywords
names		
Basin name includes	An Nahr Al Kabir; Astara Chay; Coatan Achute; El Naranjo; Great Scarcies; Har	Add quotation mark to the basin name in the
multiple words	Us Nur; Kowl E Namaksar; La Plata; Lagoon Mirim ; Lotagipi Swamp; Lough	search keywords to search it as a whole, and
	Melvin; Nahr El Kebir; Oued Bon Naima; Pu Lun T'o; Rio Grande (N. America); Rio	prevent the basin name tokenized
	Grande (S. America); San Martin; Song Vam Co Dong; St. Croix; St. John (Africa);	
	St. John (North America); St. Lawrence; St. Paul; Wadi Al Izziyah	
Same basin names	Great/Little Scarcies; Rio Grande (N. America/S. America); St. John (Africa/North	Usually, articles do not contain the continent name
exist in multiple	America)	when talking about rivers. Therefore, adding
continents		continent names into search keywords compresses
		data volume significantly and does not help with
		relevance. Adding frequency setting of riparian
		countries will filter out articles about the river on
		the other continent effectively.
Basin name includes	St. Croix; St. John (Africa); St. John (North America); St. Lawrence; St. Paul	Put 'saint' and 'St.' into search keywords together
St. (Saint)		

The *special_basin_dict* in the toolkit in *Block 1* is a python dictionary uploaded on Zenodo, whose *keys* are basin names with multiples words, or with special characters (e.g., back slash, dash, or parenthesis), and *values* are all searchable formats of the related basin names and river names. Given the original basin name to search, *special_basin_dict* can feedback its corresponding searchable keywords. If without *special_basin_dict* and using the original basin name to search, few results even none can be found. Coverage of retrieved results is enhanced by the *special_basin_dict*. When using the dictionary, import it to your script first, and call it easily.

169 (2) Block 2

Block 2 is information concerning with riparian countries within the transboundary river basin. The aim of Block 2 is to get the searchable list of the riparian country names including various formats. To fulfill the task, two helpful dictionaries basin_country_dict and basin_country_dict are developed and provided in the toolkit of this study.

173 The *basin_country_dict* in the toolkit in *Block 2* is a python dictionary uploaded on Zenodo, whose *keys* are basin names, and

174 *values* are all riparian countries located in the transboundary basin. Given the basin name to search, *basin_country_dict* can

175 feedback the list of riparian countries. Another python dictionary used in *Block 2* is *special_country_dict*, whose *keys* are

176 country names with various formats, or with special characters (e.g., dot), *values* are all the searchable formats of the country

177 name. Given the special country name to search, *special_country_dict* can feedback the list of all searchable formats of the

178 country name.

Given a basin name to search, first looking up riparian countries in the *basin_country_dict* gets the list of riparian countries; then check whether there is a special country name in the list of riparian countries. If yes, through looking up *special_country_dict*, all searchable list of the country name including various formats are generated in *Block 2*.

182 (3) Block 3

183 Block 3 contains terms concerning various themes of transboundary water resources, shown in Table 2. For example, type of 184 water body, function of water body (agriculture, fishing etc.), hydraulic infrastructure, water quantity, water quality, and other 185 specific topics which arouse certain research interests.

186 (4) Block 4

Block 4 contains conflict/cooperation related keywords, adopted from TFDD searching keywords (Yoffe & Larson, 2001), shown in Table 2. If you focus on a certain type of conflict/cooperation, keywords in *Block 4* can be modified accordingly. In addition, UNBIS Thesaurus (UNBIS Thesaurus, 2021) provides lists of related keywords for conflict and cooperation which can be referred to.

191 (5) Block 5

192 Block 5 contains excluded terms, given the research goal of our study, most of which are adopted from TFDD searching 193 keywords (Yoffe & Larson, 2001), shown in Table 2. These terms, seemingly relevant to our topics, occur in media articles 194 massively and easily bring in lots of data noise. For example, 'sea' and 'ocean' bring mass of irrelevant articles talking about 195 marine rights and navigational utilization; 'nuclear' refers to 'nuclear power' and 'nuclear threaten', which is not the main 196 concern of transboundary water conflict and cooperation; and as for 'flood of refugees', though it contains the keyword 'flood', 197 but is regarded as irrelevant to our topics. These terms prone to bring in noise should be excluded in searching results, and thus 198 list in excluded terms in *Block 5*. If researchers employ our framework in their own study fields in the future, excluded terms 199 to avoid noise in Block 5 should be modified accordingly to fit their own research field based on results of trial-and-error 200 between Step 2 and Step3 and combined with their experience and knowledge background. For example, when collecting data 201 for Aral Sea, 'sea' should be deleted from the excluded terms in *Block 5* to prevent great loss of data coverage.

Notes: asterisk (*) indicates root of a word; number in parentheses (5,2 or 3) indicate at least how many times the keywords should appear in a searching result

204 **2.2.3 Term frequency setting of keywords**

205 The setting of term frequency of keywords comes from the recursive trial-and-errors in the search process, which makes the 206 search results for most transboundary river basins relatively satisfactory. For individual river basins, universal setting rules of 207 term frequency will cause the search results drop to zero sharply or too many to cope with, and the accuracy of the search 208 results cannot be guaranteed. For example, when collecting data on the Jordan River Basin, given that Jordan is not only the 209 name of the river basin, but also the name of a riparian country in the basin, there are too many articles that meet all the search 210 requirements but purely about regional politics. Therefore, the setting of term frequency for the keywords 'water' and 'river' 211 needs to be increased to 5 times to highlight the theme of transboundary water resources and ensure that the search results have 212 similar accuracy to other river basins.

213 Taking the Lancang-Mekong basin as an example, the search keywords used in this study are shown in Table 3. During the 214 trial-and-error process, we found that the results relevance rate is far below acceptable level (less than 30%), therefore we 215 revised the keyword terms to increase frequency of certain terms until satisfactory results are produced, for example, the name 216 of the basin appears in the article were increased to at least five times, the name of any riparian country in the basin (official 217 name or abbreviation) appears in the article at least two times. Water-related words are divided into three sub-blocks: type of 218 water body, function of water body, and infrastructures for water conservancy. Among them, 'water' and 'river' appear at least 219 3 times respectively, and the rest keywords of water block appear at least once; words related to conflict, or cooperation appear 220 at least once. Recordings of trial-and-error process for Mekong, Nile and Jordan River Basin are provided in Appendix to 221 demonstrate the effects of various groups of frequency settings of keywords and how balance between relevance and coverage 222 is approaching. Although term frequency settings of keywords and justification of balance between relevance and coverage in 223 this study may not be optimal, with a certain degree of coexisting subjectivity and objectivity, they can also serve as a reference 224 for other researchers.

225

Table 3. Search Keywords in the study (Lancang-Mekong as an example)

Key Word Search	Lexis Advance Database
Must Include the Basin Name (at least 5 times)	Mekong (5)
Includes at least one of the following countries' name (at least twice)	Thai*(2), Cambodia*(2), China(2), Chinese(2), Laos(2), Myanmar(2), Burm*(2), vietna*(2)
Includes at least one of the following words related to Water	Same as Block 3 (see Table 2)
Includes at least one of the following words related to Conflict/Cooperation	Same as Block 4 (see Table 2)
Does not include any of the following noisy words	Same as Block 5 (see Table 2)

Notes: asterisk (*) indicates root of a word; number in parentheses (5,2 or 3) indicate at least how many times the keywords should appear in a searching result

226 **2.3 Step 3: Data Cleaning and Processing**

227 Before finalizing the refined datasets for further analysis, data cleaning and processing is indispensable. The first stage in Step 228 3 is Rough Manual Reading and Sorting to Check Results Relevance, which aims to provide feedbacks on how to modify 229 keywords in Step 2. Rough manual reading can be done by random sampling, or more conveniently from back to front. Since 230 lists of news results by news media databases usually have options to Sort by Relevance, frontlines displayed in the front of 231 the list of searching results are ranked as more relevant to search terms than that of the backlines of the list. ('Sort by Relevance' 232 is one of the sorting functions provided by Lexis Advance, which also provides 'Sort by Date' and 'Sort by Document Title'. 233 Among the three options, 'Sort by Relevance' works best for us to read roughly to change the frequency setting of keywords 234 by trial-and-error. Therefore, 'Sort by Relevance' was chosen before downloading the data from Lexis Advance. Usually, 235 news databases have similar functions for readers to read roughly and conveniently.) A proper percentage, like 80% of results 236 which are relevant among all, can be set to meet our expectation.

To better facilitate future analysis, all downloaded text data will go through structure formatting process. A data structuring program is developed for Lexis Advance to download and organize the text data into structured format. The relevant media articles are processed in order of relevance, and detailed information such as the publication time of the articles, media source, author, article length, etc. are stored in a structured manner. An example of structured media data is shown in Table 4. As for data integration, any news data downloaded from suitable data sources (not only from Lexis Advance) can be arranged and structured in the format of Table 4 through dada cleaning and processing procedure. After data processing, the toolkit provided by this research can be applied to the integrated data regardless of the original data sources of it.

245 2.4 Potential Analysis

The news media dataset of water conflict and cooperation on transboundary rivers allows for varieties of analysis in later stage.
This study lists several examples of potential analysis including event extraction, stakeholder analysis, sentiment analysis and topic analysis.

Event Extraction from news articles is a conventional application of water conflict and cooperation dataset. Same as what has been achieved by TFDD, water events both conflictive and cooperative, were extracted in relevant political science datasets and news articles (Yoffe & Larson, 2001). Event Extraction requires concise and accurate information recognition and extraction from latent content in text data. Since human coders perform better than machine programming (Howland et al., 2006), human coding event extraction is recommended.

Stakeholder Analysis for transboundary rivers is a way to identify who has been involved in transboundary water issues, and the roles they play in the game, i.e., understanding the demands and expectations of the major stakeholders inside and outside the basin, based on typical definition of stakeholder analysis (Smith, 2000). News media represent or reflect the interests of its home country, thus via analysis of news media sources in a transboundary basin, political positions and economic interrelationships between riparian countries and other extra-territorial countries lying outside the basin are uncovered. Longitudinal analysis has capability to depict the trajectories of a stakeholder country's interests and reveal the evolution of stakeholder countries in transboundary water issues.

Sentiment analysis on the news media dataset on transboundary rivers can bring the implicit information to the surface (Jiang et al., 2016), since willingness of cooperation and hostility of conflicts often hide behind the news articles. Positive and negative sentiment are closely to dynamics of conflict and cooperation in transboundary water issues, which serve as precursors of significant situational changes. Sentiment lexicons (Khoo & Johnkhan, 2018) or machine learning (Neethu & Rajasree, 2013) are major methods for sentiment analysis in text mining.

266 Topic analysis tells the story about main interests and concerns of the news media, even the stakeholders along with time
267 (Jacobi et al., 2016). Topics concerned along with society development, evolutionary trajectories of transboundary water issues
268 can be uncovered through popular algorithms of topic modelling analysis, such as LDA (Alsumait et al., 2009).

269 3 Results

This section overviews the Global Datasets statistically both in terms of spatial coverage and content coverage, which aims to show the datasets telling stories of conflict and cooperation on transboundary rivers from all aspects in a global scale. To

demonstrate the effectiveness of the methodological framework and toolkit, manual reading to check the improvements of data

273 relevance was conducted on four representative basins including Nile, Mekong, GBM, and Columbia.

274 **3.1 Overview of the Global Datasets**

275 3.1.1 Spatial Coverage

276 (1) Continental Coverage

- 277 With the customized search strings for each transboundary river and the data structured program developed for Lexis Advance
- to organize the data, as of March 10, 2019, the data volume results of 286 transboundary river basins around the world are
- shown Figure 3 Spatial Coverage. In Figure 3, the base map of transboundary river basins around the world was downloaded
- from TFDD in the format of GIS shapefiles (Transboundary Freshwater Dispute Database, 2008).

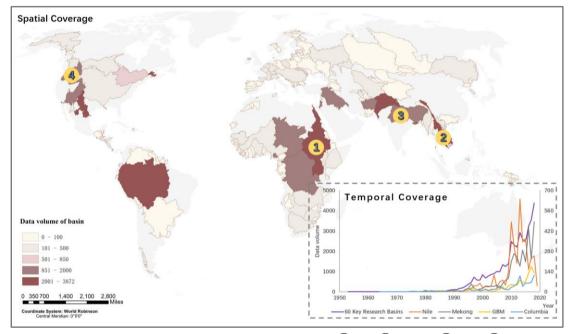

Figure 3. Spatial coverage and temporal coverage in basin scale (1)Nile; 2)Mekong; 3)GBM; 4)Columbia)

Data volume of news articles reflects the prominence of the conflict and cooperation events discussed in transboundary river basins. Enough data volume promises statistical significance. The mainstream application of this news media dataset is further text mining to track conflict and cooperation dynamics on transboundary rivers. For text mining purpose, this study assumes arbitrarily that 100 media articles are the minimum data volume to track dynamics transboundary rivers along with time.

Overall, there are 60 river basins with more than 100 media articles, which are considered as the Key Research Basins of transboundary water conflict and cooperation in our research. The number of news articles discussing these 60 Key Research Basins reached more than 41,000. Among the 60 Key Research Basins, 16 river basins have more than 850 data records as shown in Table 5, which attract more attention and are considered as Heated Basins. Note that the definition criteria of Key Research Basins (more than 100 articles) and Heated Basins (more than 850 articles) are flexible and adaptive according to specific research demands.

293

Table 5. 16 Most-discussed Basins with more than 850 records

Order	Basin Name	Continent	Number of records	Countries
1	Nile	Africa	3872	Burundi, Central African Republic, Egypt, Hala'ib Triangle, Eritrea, Ethiopia, Kenya, Rwanda, Sudan, Abyei, South Sudan, United Republic of Tanzania, Uganda, Dem. Republic of the Congo
2	Mekong	Asia	3253	China, Cambodia, Lao People's Democratic Republic, Myanmar, Thailand, Viet Nam
3	Rio Grande (N. America)	North America	2718	Mexico, United States of America
4	Indus	Asia	2404	Afghanistan, China, India, Nepal, Pakistan
5	St. John (North America)	North America	2356	Canada, United States of America
6	Amazon	South America	2078	Bolivia, Brazil, Colombia, Ecuador, French Guiana, Guyana, Peru, Suriname, Venezuela
7	Colorado	North America	1975	Mexico, United States of America
8	Jordan	Asia	1816	Egypt, Israel, Jordan, Lebanon, West Bank, Syrian Arab Republic
9	Congo/Zaire	Africa	1391	Angola, Burundi, Central African Republic, Cameroon, Congo, Gabon, Malawi, Rwanda, Sudan, South Sudan, United Republic of Tanzania, Uganda, Dem. Republic of the Congo, Zambia
10	Lake Chad	Africa	1353	Central African Republic, Cameroon, Algeria, Libya, Niger, Nigeria, Sudan, Chad
11	Ganges- Brahmaputra - Meghna	Asia	1183	Bangladesh, Bhutan, China, India, Myanmar, Nepal
12	Helmand	Asia	1168	Afghanistan, Iran (Islamic Rep of), Pakistan
13	Cross	Africa	1110	Cameroon, Nigeria
14	Tigris- Euphrates/Shatt al Arab	Asia	939	Iran (Islamic Rep. of), Iraq, Jordan, Saudi Arabia, Syrian Arab Rep., Turkey
15	Columbia	North America	859	Canada, United States of America
16	Tijuana	North America	853	Mexico, United States of America

294 Most studies of conflict and cooperation on transboundary rivers focus on individual basins, which seeks solutions to dealing 295 with local challenges on transboundary water resources (Bernauer & Böhmelt, 2020). Therefore, formation of general 296 understanding of conflict and cooperation on transboundary rivers needs global data support besides expert on-site experience 297 from research of individual basins. Many most-discussed transboundary river basins such as the Nile, Mekong, Indus, GBM, 298 and Tigris-Euphrates/Shatt al Arab etc. are located in regions featured with frequent tensions and armed conflicts (Pohl et al., 299 2014), and are well-known by people. However, this study finds that there are also some river basins from the authors' point 300 of view, which less attention has been paid to in the past in terms of transboundary water conflict and cooperation research, 301 e.g., St. John River (North America), and Tijuana River.

Data volume of transboundary water conflicts and cooperation news articles in the datasets of 60 Key Research Basins on different continents: for Asia is 14454, for North America is 11306, for Africa is 10734, for Europe is 2674, for South America is 2498. It could possibly be attributed to the discrepant levels of economic development of major countries on each continent, or varied attention paid to discussion of management of transboundary rivers. The other important reason could be the linguistic variations. Since this paper chose English newspaper as the search scope, the large amount of data in North America and the small amount of data in Europe could be due to system bias caused by language preferences.

308 There are notably large amount of transboundary water conflicts and cooperation events reported in Asia and Africa, which 309 indicates that transboundary water management is a major topic of peace and development in both Asia and Africa. Taking 310 into consideration that most countries on these two continents do not speak English as their mother language, the existence of 311 a large number of news media articles on transboundary water conflicts and cooperation between Asia and Africa, on the one 312 hand, reflects the fervent concerns about the transboundary water resources, and the desires for peace and development; on the 313 other hand, it also reflects that people around the world are more involved in transboundary water issues in Asia and Africa. 314 and have invested heavily in the development and construction and pay close attention to these two rapidly developing and 315 eye-taking continents.

316 (2) National Coverage

317 News media data volumes in the datasets of 60 Key Research Basins from different countries in the world are shown in Figure 318 4 - Spatial Coverage. In Figure 4, the base map of countries around the world was downloaded from ArcGIS Hub in the format 319 of GIS shapefiles (Esri Data and Maps, 2021). It is seen that United States of America contributes 11515 news articles on 320 transboundary water conflict and cooperation, ranking number one, both as a riparian stakeholder in the transboundary water 321 issues with Canada and Mexico, and as an extra-terrestrial international stakeholder involving in the transboundary water 322 issues on continents other than the North America. Since a country's development and utilization of transboundary freshwater 323 resources inevitably involves relations with other riparian countries, and transboundary water cooperation and conflicts often 324 involve broader economic and social ties between riparian countries, transboundary freshwater management is an important 325 component of the diplomacy of riparian countries; on the other hand, due to factors such as global hegemony, transnational 326 investment, colonial history and other factors, transboundary freshwater management often involves countries outside the 327 region, becoming a stage for great powers to play (Mirumachi, 2015).

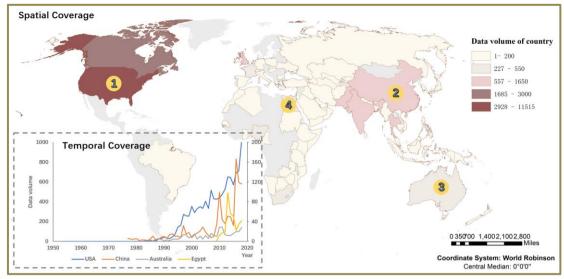

Figure 4. Spatial coverage and temporal coverage in country scale (1)USA; (2)China; (3)Australia; (4)Egypt)

330 3.1.2 Temporal Coverage

331 Temporal coverage of the datasets of 60 Key Research Basins (stated in Spatial Coverage section) and four case study basins 332 are shown in Figure 3 - Temporal Coverage, which shows how many news media articles released along with years on 333 transboundary water conflict and cooperation. Noted that due to differences of order of magnitudes, data series of 60 Key 334 Research Basins uses the major vertical axis which ranges from 0 to 4500, and the four case study basins share the minor 335 vertical axis which ranges from 0 to 700. The datasets cover from the year of 1953 to 2019. Boom of news articles on 336 transboundary water conflict and cooperation emerges from 1990s, and potentially continues in the future. That emphasizes 337 the necessity to revise the methodological framework and toolkit for news media dataset tracking of conflict and cooperation 338 dynamics on transboundary rivers to cope with the era of big data. For the four case study basins, the changing trends of data 339 volume display strong vibrates, which may be affected by certain water events and geopolitical relations in the river basins at 340 the moment.

341 Temporal coverage of four representative countries, which are United States of America (USA, using the vertical minor axis 342 on the left), China, Australia and Egypt (using the vertical major axis on the right), is shown in Figure 4 – Temporal Coverage. 343 USA contributes the largest volume of data among countries in the world; China promotes transboundary cooperation in 344 Mekong River Basin actively in the recent years; Australia does not have a transboundary river with other neighbouring 345 countries, but releases lots of news articles on transboundary water issues; and Egypt is one of the major countries in Nile 346 River Basin, which is representative in transboundary water conflict and cooperation. Same with the temporal coverage of 347 basin analysis, country datasets also cover from the year of 1953 to 2019. Data volume took off from 1990s, and potentially 348 continues in the future as well. For the four representative countries, the overall trends of data volume go up along with time 349 and are affected by contextual events in the country to show strong vibrates.

350 3.1.3 Content Coverage

Word frequency analysis demonstrates that this study has generated good datasets tracking of conflict and cooperation dynamics on transboundary rivers. In the datasets, words concerning with water body function, hydraulic infrastructure construction, basin management, national power, civic rights, jointed research and water conflict and cooperation appear in a high frequency, consistent with the related keywords in TFDD (Yoffe & Larson, 2001) and relevant words provided in UNBIS Thesaurus (UNBIS Thesaurus, 2021). This indicates that the datasets are closely corresponding to the research question, providing data as needed.

357 3.2 Relevance Screening

358 The major advancement of this methodological framework is that it allows efficient and effective tracking of transboundary 359 rivers conflict and cooperation events. The keywords generator developed in this study could result in an acceptable level of 360 relevance without too much manual coding intervention. To demonstrate the effectiveness of this methodological framework, 361 four river basins: Mekong, Columbia, Nile, and GBM were taken as case studies to conduct manual coding process. Two 362 manual coders, who were trained beforehand, were involved to work independently for the four basins in the coding process. 363 Each one undertook half of the total workload in which articles in the datasets were divided into two groups randomly. Before 364 starting, inter-coder reliability test was conducted. The test randomly selects 50 articles from the datasets for two coders to 365 read, differences were then discussed, and definitions were given to reach common understanding. Krippendorff's Alpha-366 Reliability was calculated as 0.81, which is considered as valid and consistent (Krippendorff, 2004).

The total number of downloaded articles, after removing duplicates by the function of removing duplicates in the data panel of Microsoft Excel, and the remaining number of relevant articles with removal of the duplicates are shown in the Table 6. The calculation Equation of Relevance Percentage is shown as Eq.1.

370

Table 6. Manual reading results of representative river basins

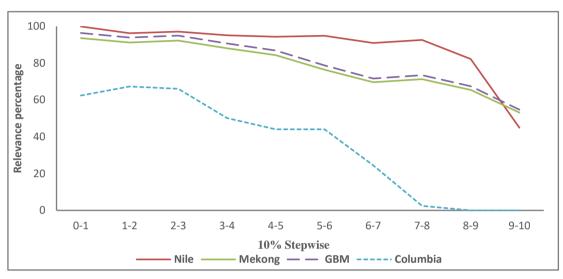

Basin name	Number of	Number after removing	Number after removing	Relevance percentage	
	downloaded	duplicates	irrelevant	(%)	
Nile	3872	3563	3164	88.80	
Mekong	3253	2917	2291	78.54	
GBM	1183	1092	724	66.30	
Columbia	859	817	295	36.11	

371 Relevance percentage = $\frac{\text{Number after removing irrelevant}}{\text{Number after removing duplicates}} \times 100\%$,

(1)

The last column of Table 6 shows the Relevance Percentage for the four river basins in a descending order. The relevance percentage of Nile, Mekong and GBM are at acceptable level, and that of Columbia is less satisfying. This is due to Columbia belonging to special basin name category, details shown in 2.2.2 a), whose basin name is same as the name of a certain riparian country or state. To further investigate of relevance percentage of the four basins, the relevance percentage in 10% stepwise is

- 376 calculated for each basin using Eq. 2. The relevance percentage in 10% stepwise for the four basins is shown in Figure 5. In
- Figure 5, the horizontal axis is every 10% Stepwise segment of the news media articles data, and the vertical axis indicates the
- 378 Relevance Percentage of that segment of data.
- 379 Relevance percentage in 10% stepwise =
- 380 Relevance percentage for every 10% of the total number after removing duplicates ,
- 381

(2)

382 383

Figure 5. Relevance Percentage in 10% Stepwise for the four basins

384 The purpose of Figure 5 is to demonstrate the necessity to apply special treatments for some river basins. Since the datasets 385 retrieved from Lexis Advance are sorted by relevance, frontlines are naturally more relevant than the backlines, and the 386 Relevance Percentage in 10% Stepwise displays descending trendlines. However, slopes of the trendlines of relevance 387 percentage in 10% stepwise between basins reflect heterogeneity of data quality. The Relevance Percentage for Columbia is 388 unsatisfactory even in the first 10% of the article list, since 'Columbia' is both a district's name and a commercial brand, listed 389 in Table 1. It makes sense that the data quality of Columbia River Basin is not as good as others. Special treatment for Columbia 390 should be adopted here to improve the data quality, as well as special treatments are needed for certain categories of basins 391 and corresponding treatments as mentioned in Table 1. To do so, usually enforcement of the frequency constraints shown in 392 Sect. 2.2.3 (i.e., raise the frequency setting for 'water' and 'river' to filter out the geopolitical articles as many), or removal of 393 the most irrelevant articles in the end of the dataset work well. With an anticipation of relevance percentage in mind, random 394 sampling or manual reading of the last percentage of articles are often undertook to check the data quality. For example, given 395 the Relevance Percentage in 10% Stepwise for Columbia, raising the frequency setting of 'water' and 'river' to 5 times, or 396 removal of the last 40% of the data retrieved in the Original Dataset due to its low relevance in general are feasible solutions 397 to improve data relevance. For other basins with satisfactory data relevance, no further operation is needed; and for the other

398 basins, similar operations as for Columbia River Basins can be adopted before further potential analysis.

399 4 Summary

400 Management of transboundary rivers is challenging both in terms of political and environmental in the 21st century. Data 401 support is crucial for research of conflict and cooperation on transboundary rivers. Conventional construction manner of dataset 402 by manual reading and extraction cannot meet the requirement for fast-updating in the big data era. This study brings up a 403 revised methodological framework based on the conventional and toolkit for news media dataset tracking of conflict and 404 cooperation dynamics on transboundary rivers. Design of the framework follows closely Lasswell' communication model 405 (Lasswell, 1948) involved with seven elements- "who, with what intentions, in what situations, with what assets, using what 406 strategies, reaches what audiences, with what result". Basic search keywords were adopted from TFDD and further revised to 407 include five blocks of terms to make it extensible and adjustable according to a certain research topic. Through Block 1 and 408 Block 2 with corresponding toolkit (shown in Figure 2), a dataset covering transboundary rivers in a global scale can be 409 generated, which is improved than results of TFDD. All the special treatments for basin names (shown in Table 1), country 410 names (shown in Block2), and term frequency setting of keywords (stated in Section 2.2.3) are crucial measures to enhance 411 data quality and save manual efforts, which are improvement beyond achievements of TFDD. Following the methodological 412 framework, a dataset with good trade-offs between data relevance and coverage is generated. This study demonstrates the 413 effectiveness of the framework and the potency of our toolkit. This framework possesses extensibility and compatibility to 414 other research topics besides transboundary water resources management since the search terms are adaptive and the toolkit is 415 transplantable for related future research. With this revised framework and toolkit, research using news media tracking of 416 conflict and cooperation dynamics on transboundary rivers will be much easier and more practicable.

417 Implications of this research can be manifested through how we can use the news media dataset generated by the 418 methodological framework and toolkit tracking of conflict and cooperation dynamics on transboundary rivers. The dataset can 419 serve as the foundation for further analysis, e.g., to study the attitudes, the topics of concerns, and the relationship between the 420 evolution of the water governance network and the level of integrated water management along the evolution of water conflict 421 and cooperation in the transboundary river basins. Ultimately it can contribute to understanding of the driving mechanisms and transformation laws of water conflict and cooperation. By capturing the characteristics of life cycles of water conflicts and 422 423 cooperation, future researchers can explore the temporal evolution trend and spatial distribution law of global transboundary 424 water conflicts and cooperation events, as well as the guiding significance of appropriate policy intervention, and improve the 425 level of global water security.

426 Meanwhile, this research and the dataset can also serve as a methodological and statistical foundation of quantifying the social 427 dimension in socio-hydrological approaches of understanding transboundary river system. Recent attempt has been made to 428 take socio-hydrological approach to tackle the feedback mechanism of co-evolved sub-systems (Lu et al., 2021). While sociohydrological model can contribute to understanding the complexity of the intertwined nature of transboundary river system, quantifying the social variable has been challenging in general. There has been increasing recognition that news media provides a valid proxy to reflect the changing values and interest of each riparian country (Wei et al., 2021), conflict and cooperation sentiments that reflected from news article have been adopted in socio-hydrological models as the willingness of cooperation to validate the social sector of the model (Lu et al., 2021). When expanded to other river basins, this study could provide a methodological support in measuring the social sector of transboundary river systems more effectively.

Still this study has some limitations which could be overcome in following researches: (1) absence of newly-registered rivers: the list of transboundary rivers adopted in this study includes 286 rivers, which could be expanded to 310 rivers in the near future; (2) language limitation: the scope of this study limits to English newspaper only due to our limitation of language processing, which could be expanded to include more main languages and local languages in transboundary river basins; (3) absence of tributary information: in the keywords generator, tributaries of transboundary rivers are not included, which may lose content coverage to some extent. Future work can add more details concerning tributaries of transboundary rivers.

441 *Code and data availability.* The data and code used in this study are publicly available on Zenodo (including: basin-country dictionary; 442 dictionary of country names with different formats (special country dictionary); dictionary of basin names with different formats; python 443 code of searching term generator. DOI: 10.5281/zenodo.5112624

444 *Author contributions.* LG, JW, and FT designed the research framework. LG collected data and conducted data analysis. LG, JW, KZ, and 445 J.L.W conducted manual reading for the case studies. LG, JW and FT composed the manuscript with contribution from KZ and J.L.W.

446 *Competing interests.* The authors declare that they have no conflict of interest.

447 *Special issue statement.* This article is part of the special issue "Socio-hydrology and transboundary rivers". It is not associated with a conference.

501

502

503 Appendix

504 Recordings of trial-and-error process are provided as follows to demonstrate the effects of various groups of frequency settings 505 of keywords and how balance between relevance and coverage is approaching. Two justification indicators of data relevance 506 are adopted: (1) Indicator 1: the number of articles relevant to our research topic within 20 articles at 60% of total data volume. 507 For example, there are 10000 articles retrieved by the certain frequency setting of search terms in Lexis Advance, we locate 508 the article at exactly 60% of total data volume, which is the 6000th articles, and read 20 articles from there. Therefore, Indictor 509 1 is how many articles are relevant among 6001st-6020th articles. (2) Indicator 2: the number of articles relevant to our research 510 topic within 20 articles at 80% of total data volume. Similar to the algorithm of Indicator 1, if the total data volume is 10000, Indictor 2 is how many articles are relevant among 8001st-8020th articles. Table 7 presents the results of trial-and-error process 511 512 of frequency settings of keywords for Mekong, Nile and Jordan River Basin, and shows that strong frequency settings enhance 513 data relevance prominently, and at the same time reduces data volume to a large extent. To promise a balance between data 514 relevance and coverage, proper frequency settings of search keywords should be adopted. In this study, Test 6 is adopted as 515 the final setting. Notice that Nile and Jordan River Basin have overwhelmingly large volume of data if no additional constraint 516 are exerted, therefore ("Nile River" OR "Nile Basin" OR "Nile Water") or ("Jordan River" OR "Jordan basin" OR "Jordan 517 water") are added to basic search terms to limit data volume to an acceptable extent. While conducting trial-and-error processes, 518 topics of irrelevant articles are also recorded to show the potential causes of irrelevance and may provide us some hints to 519 modify the search terms for a better performance, shown in Table 8.

520

Table 7. Trial-and-error process of frequency settings of keywords for Mekong, Nile and Jordan

Test		Frequency	settings			Mekong			Nile			Jordan	
index	Basin name	Riparian country	Water	River	Data volume	Indicator 1	Indicator 2	Data volume	Indicator 1	Indicator 2	Data volume	Indicator 1	Indicator 2
1	1	1	1	1	27975	5	2	16227	8	4	28604	3	0
