Summary:

This document contains pictures of the Vallon de Nant catchment (Figure S1 and Figure S2) and gauging station at the outlet (Figure S3). Next the Figure S4 shows the hypsometric curve of the Vallon de Nant. The Figure S5 present three along stream streamflow measurements, and the Figure S6 the location of all sources in the catchment. The Figure S7 presents a comparison of the electric conductivity of water samples when they were sample in the field and measured in the lab months after. Figure S8 combine time series of water table depth and temperature at PZ1 and PZ2.

The Table S1 resume the start and end dates of each hydrological period, and the Table S2 the start and end dates of each snowcover period at the soil temperature points.

Figure S1. Pictures of the Vallon de Nant.

Figure S2. Comparison of vegetation cover between a historical picture (1912 or before, on top) and an actual picture (2017, on bottom). Credit for the top picture: Robert di Salvo

Figure S3. River stage measure at the outlet. The streamflow is here measured between 0.96 and $1.13 \text{ m}^3 \cdot \text{s}^{-1}$.

Figure S4. Hypsometric curve of the Vallon de Nant.

Figure S5. Discharge (top) and specific discharge (bottom) along the main stream measured by the Stream Biofilm and Ecosystem Research Laboratory group (EPFL) and the Catchment hydrology group (UNIL). The mean specific discharge measured at the outlet during the measures was 2.2 mm d^{-1} (1.7 to 2.8 mm d^{-1}) on 13 Sept. 2016, 2.0 mm d^{-1} (1.5 to 2.5 mm d^{-1}) on 3 Nov. 2016, and 3.6 mm d^{-1} (2.9 to 4.4 mm d^{-1}) on 9 Aug. 2017. The vertical line at 4.15 km shows the stream network node beyond which the followed path diverges between the main stream (3 Nov. 2016) and an affluent (13 Sept. 2016 and 9 Aug. 2017).

Figure S6. Location of all the springs (red square dots) in the Vallon de Nant. The slopes calculation is based on a digital elevation model at a resolution of 2 m (swissAlti3D, 2012).

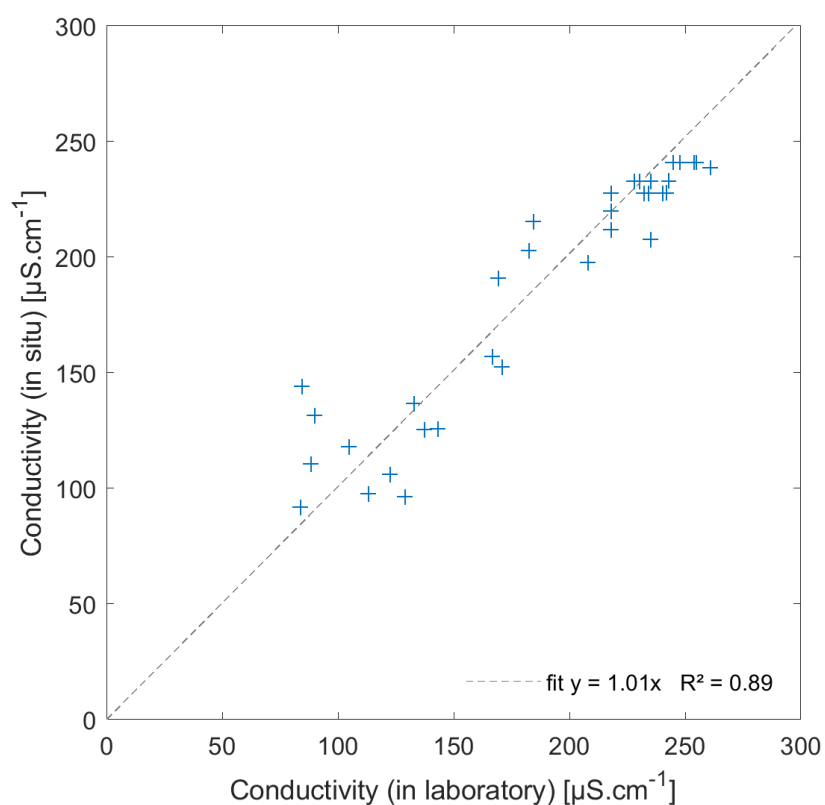

Figure S7. Comparison of 38 samples conductivity measured on the field using a WTW Multi 3510 IDS with a WTW TetraCon 925 probe (Xylem Analytics Germany Sales GmbH & Co, Weilheim, Germany) or later in the laboratory directly within the 12 mL amber silicate vials using a JENWAY 4510 Conductivity Meter with a 6 mm glass probe (Stone, UK).

Figure S8. Water table depth (top) and temperature (bottom) at PZ1 and PZ2 from 1 July 2017 to 1 October 2018. Water table depth and temperature data are from Thornton et al. (2021).

Table S1. Start and end dates of each hydrological period.

Period	Start date	End date
B0	1 January 2016	31 March 2016
E0	31 March 2016	6 May 2016
M0	6 May 2016	24 June 2016
R1	24 June 2016	27 September 2016
B1	27 September 2016	18 March 2017
E1	18 March 2017	6 May 2017
M1	6 May 2017	2 June 2017
R2	2 June 2017	27 September 2017
B2	27 September 2017	8 April 2018
M2	8 April 2018	31 May 2018
R3	31 May 2018	1 January 2019

Table S2. Start and end dates of each snowcover period at the soil temperature points.

Soil temperature site	Start date	End date
1240 m asl.	3/2/2016	16/3/2016
	4/1/2017	13/3/2017
	25/11/2017	7/4/2018
1530 m asl.	1/1/2016	14/5/2016
	4/1/2017	9/5/2017
	5/11/2017	29/5/2018
2640 m asl.	1/1/2016	9/7/2016
	4/10/2016	25/11/2016
	4/1/2017	13/6/2017
	22/10/2017	6/6/2018
