Supplementary Figures

Supplementary Figure S1: Map of the 51 catchments used to study streamflow changes to afforestation and climate. They include the original catchments studied in Buechel et al. (2022), near-natural catchments over 150 km² from the UKBN2 network and the catchment for the Dee and regions in Scottish hydro-regions where there were no catchments from the initial selection.

Supplementary Figure S2. Location of the COSMOS-UK sites used to validate model outputs.

25

Supplementary Figure S3: Number of UKCP18 regions that show significant changes ($p < 0.01$ with ANOVA) in the system states (on the x axis), for the entire period for the four variables altered: CO₂, afforestation (landcover), precipitation and temperature. Only in the Orkney and Shetland region are significant changes seen due to afforestation. Supplementary Material Figure S4 shows how this varies per season. Northeast Scotland not included due to computational issues.

30

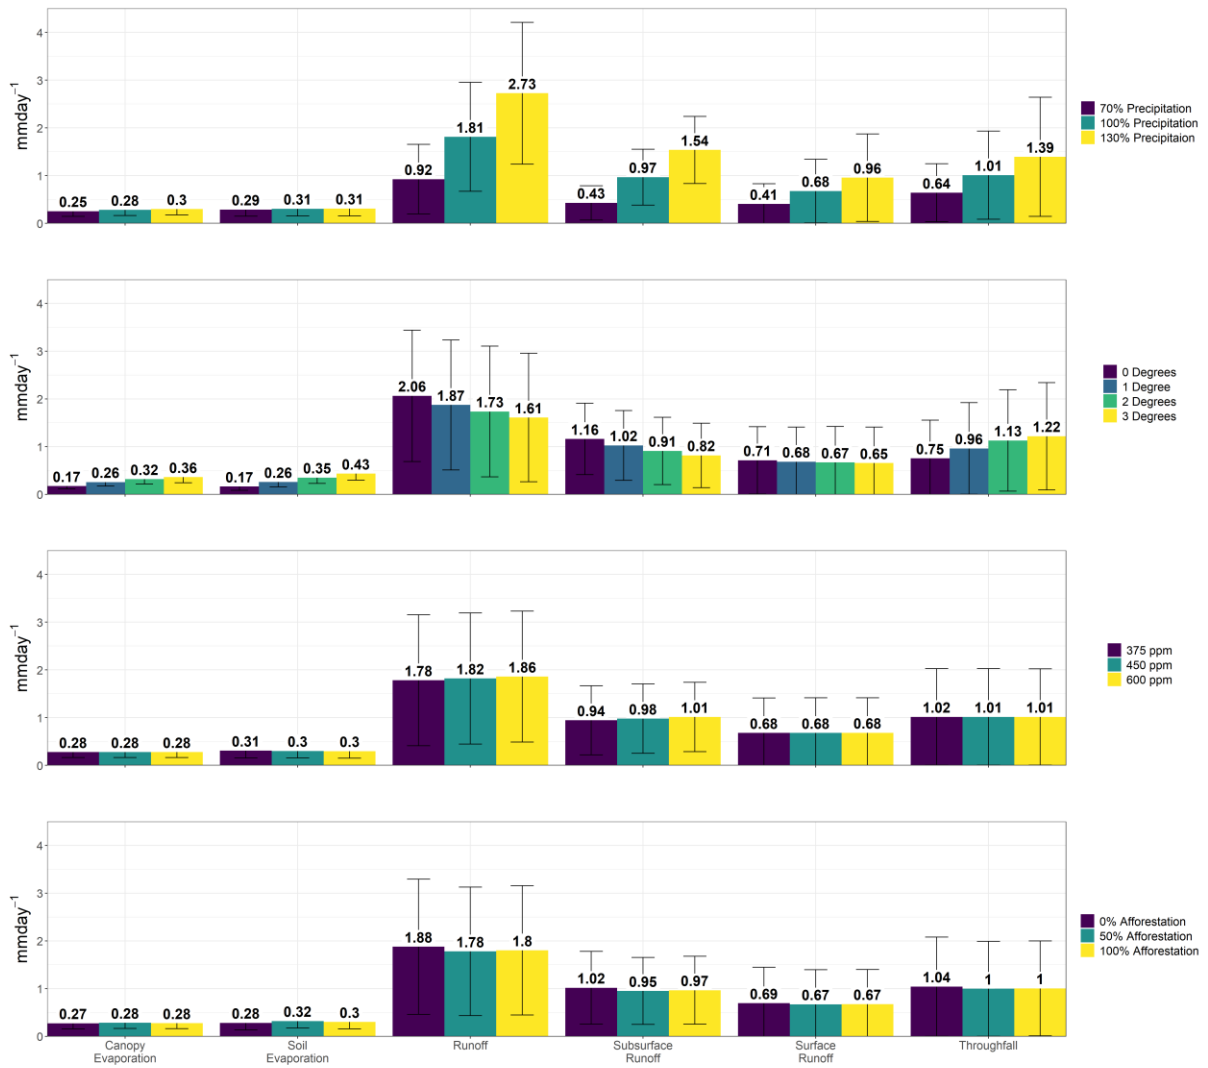

35 **Supplementary Figure S4: Number of UKCP18 regions that show significant changes ($p < 0.01$ with ANOVA) in the system states (on the x axis), for the entire period for the four variables altered: CO₂, afforestation (landcover), precipitation and temperature. The graphs are for winter and summer. Northeast Scotland not included due to computational issues.**

40

Supplementary Figure S5: Mean hydrological fluxes across all UKCP18 regions in summer for each of the four variables altered: precipitation, temperature, CO2 and landcover. Error bars indicate one standard deviation.

45

Supplementary Figure S6: Mean hydrological fluxes across all UKCP18 regions in winter for each of the four variables altered: precipitation, temperature, CO₂ and landcover. Error bars indicate one standard deviation.

Supplementary Tables

50 **Supplementary Table S1: Error metrics for the 51 catchments in this study for the period 2000-2015.**
