

Supplementary tables

Table S1. Spatial data used to discretize and parameterize the HRUs implemented in Raven.

Variable	Purpose	Source
Elevation	Delineating catchment boundaries; parameterizing HRUs for elevation, slope aspect, slope gradient	¹ Canadian Digital Elevation Model 3.0
Leading tree species, canopy closure, stand height, harvest year	Discretizing HRUs; informing parameterization of HRUs for leaf area index, canopy interception, canopy closure, regenerating stand height	² 2012 VRI - Forest Vegetation Composite Polygons and Rank 1 Layer
Wildfire year		³ Fire Incident Locations – Historical
BEC variant	Discretizing HRUs; informing parameterization of HRUs for leaf area index, canopy interception, canopy closure, clumpiness	⁴ Biogeoclimatic Ecosystem Classification Map
Soil	Discretizing HRUs; informing parameterization of HRUs for soil texture, porosity, depth, permeability, runoff rate	⁵ Soil Survey Spatial View

Table S3. Performance statistics from the model calibration and validation.

Dataset		Objective function	Performance	
			Calibration	Validation
Composite value		¹ Mean	0.87	0.79
Fit to spring freshet discharge	Penticton Creek	² NSE	0.81	0.81
	240 Creek	NSE	0.78	0.74
	241 Creek	NSE	0.77	0.80
	Dennis Creek	NSE	0.78	0.52
Fit to spring freshet discharge with 15-day smoother	Penticton Creek	NSE	0.87	0.87
	240 Creek	NSE	0.93	0.86
	241 Creek	NSE	0.91	0.88
	Dennis Creek	NSE	0.90	0.68
Spring freshet bias	Penticton Creek	³ Absolute bias	0.97	0.96
	240 Creek	Absolute bias	0.98	0.91
	241 Creek	Absolute bias	0.93	0.94
	Dennis Creek	Absolute bias	0.90	0.94
Low flow bias	Penticton Creek	Absolute bias	0.87	0.35
	240 Creek	Absolute bias	0.79	0.72
	241 Creek	Absolute bias	0.79	0.71
	Dennis Creek	Absolute bias	0.61	0.47
Fit to SWE		NSE	0.95	0.93
SWE bias		Absolute bias	0.96	0.95
Precipitation bias at Penticton Airport		Absolute bias	1.00	0.97

1. Arithmetic mean of all metrics listed
2. Nash-Sutcliffe Efficiency
3. One minus absolute bias (normalized by mean of observed)

Table S4. Discharge ($\text{m}^3 \text{s}^{-1}$) for 2 and 100 year return periods by event type, landcover condition, and climate condition. Values estimated through the event frequency analyses on output from the long-term simulations (Figure 10).

Climate condition	Landcover condition	Annual max discharge		Summer min discharge		Annual discharge	
		2 yr.	100 yr.	2 yr.	100 yr.	2 yr.	100 yr.
Current	Forested	13.8	22.9	0.172	0.0817	1.34	0.620
	Small burn	14.0	22.9	0.176	0.0827	1.35	0.631
	Large burn	15.8	26.9	0.209	0.0919	1.57	0.792
	1976	14.3	24.2	0.180	0.0836	1.48	0.683
	2012	14.3	23.0	0.175	0.0818	1.38	0.642
2050s	Forested	12.1	27.0	0.0832	0.0564	1.19	0.576
	Small burn	12.3	27.0	0.0837	0.0566	1.20	0.583
	Large burn	15.2	31.1	0.0915	0.0594	1.39	0.718
	1976	13.3	29.5	0.0860	0.0579	1.31	0.641
	2012	12.9	28.1	0.0842	0.0565	1.23	0.594
2080s	Forested	10.1	27.9	0.0610	0.0415	1.33	0.747
	Small burn	10.1	28.1	0.0612	0.0417	1.34	0.754
	Large burn	12.5	31.0	0.0660	0.0442	1.52	0.898
	1976	11.6	30.5	0.0627	0.0425	1.46	0.826
	2012	10.6	28.9	0.0615	0.0417	1.36	0.771
